MORROW COASTER BRAKE

Read the following:

Springfield, Mass,
August 2nd, 1907.

ECLIPSE MACHINE CO.,

DEAR SIRS:—

I would like to say in regard to your Morrow Coaster Brake for Motorcycle, that I received in June, 1907, I have used the brake and have tested it well and I can truthfully say I have never used a brake that will work with as little energy and hold the Motorcycle as well and on all occasions as will your Morrow Brake. I have recommended it to others.

Wishing you every success, I am sincerely yours,

ROLLIN A. RICHMOND, JR.,
118 Green St.

P. S.—I am using it on an Indian Motor.

hree Shows—One Management

e motor boat show situation has been ly cleared up for the coming sea- and there will be but one show in of the three show cities—New York, on and Chicago, with Chester I. pbell, the show expert, as general ger of all three.

e first national show of the season be at Grand Central Palace, New , December 7 to 14, under the aus- of the National Association of En- and Boat Manufacturers.

e Chicago show, under the auspices ne American Association of Engine Boat Manufacturers, is the second ne list of national shows, and will be at the Coliseum January 1 to 8, 1908. year two rival shows were held in ago, and the trade was practically di- l into factions, but the situation now been arranged to the mutual satis- on of all concerned.

e third show will be at Boston in the anics' Building, January 25 to Feb- 1, 1908, under the auspices of the England Engine and Boat Associa-

three associations have appointed Campbell as general manager, and he stablished his headquarters at 5 Park re, Boston, Mass.

U. S. Rules to be Enforced

ited States Steamship Inspectors of ny have issued instructions to all own- f motor boats now skipping up and the Hudson, that the new rules re- y established for the guidance of these river craft must be faithfully obeyed. e new rules to be enforced by the in-

mouth and each boat will have a fog horn If the craft is engaged in carrying pas sengers for hire extra equipment for safety of life, such as life preservers, etc., must be carried. The operator of the boat will have to be licensed and a card copy of the pilot rules must be exhibited in a con spicuous place.

1908 "Anderson" Marine Motors

The Anderson Marine Engine Co., Shel byville, Ill., has made several importan improvements in its engines for 1908, the 4-cylinder 5x6 model of which is here shown.

By the use of a recently patented de vice, each cylinder is oiled automatically by an individual oiler, which is so de signed and arranged that it opens and closes automatically with the starting and stopping of the engine. This system is very positive and effective, and the manufacturers claim it is impossible for a cylinder to run dry as long as any oil remains in the cup. All bearings are also oiled by a positive system, and the splash system is dispensed with entirely.

1908 Four-Cylinder "Anderson" Marine Motor.

The "Anderson" Engine is of the four cycle type, and each cylinder is cast separately. All parts are accessible and easily removed if necessary. Large hand hole plates are arranged on both sides of the base where all cams, rollers and gears are enclosed. This and other im provements make these engines practical ly noiseless. The inlet and exhaust valves are extra large and both are operated me chanically. They are arranged on oppo site sides of the cylinders, and are inter changeable. Water circulation has been given much consideration, and the engine can, it is said, be run continually any number of hours without overheating any part. Cylinders and heads are cast in one

1908 Changes in "Moore" Engin

Palmer-Moore Engine Co., 313-317
Washington street, Syracuse, N. Y.,
made several improvements in
"Moore" marine motors for 1908,
chief changes being in the method o
ing the connecting-rod and the shap
the cylinder-heads. Formerly the c
der-head bolts went thru the water-ja
but a change has been made to allow
passing thru solid stock, while at
same time preserving a sufficient w
jacket in the heads. This is a decide
vantage when salt water use is co
ered. In oiling the connecting-rods
employ the pump principle as made p
ble by their cross-head guide cons
tion to force the oil thru the rod itse
to the bearing. The oil-cup is located
the bottom of the cylinder, and as fa
can be seen there is no connection
tween the cup and the rod, yet the
tem is said to work perfectly, and is
neat and attractive in appearance.

We print on this page each month an exact statement of the number of copies printed and distributed of the preceding issue of "The Cycle and Automobile Trade Journal."

The bindery count of actual complete copies produced of the October issue was 20,097.

Of these, 20,953 pounds were mailed at pound rates, as shown by post office receipts. Each copy weighs 20½ ounces, representing 16,353 copies, and 2,646 copies of back numbers and copies returned by news companies are accounted for, in addition to the total for the month.

We will be pleased to verify the above figures at any time to any one interested.

New Jersey Club's 24-Hour Endurance Run

New Jersey Automobile and Motor Club's 24-hour race set for Friday and Saturday, November 15, and 16, will be merely an endurance contest on a twenty-four hour schedule. The route as laid out will be covered twice in the two days, and will take the contestants over 94.4 miles. Consumption of gasoline and oil will not figure in the awards, but the contestants will be scored for repairs and replacements and for tardy arrivals at controls. In this run the cars will be considered in one class, the division of touring cars and runabouts not being made.

A Criticism

To the Editor:—

In your issue of September 1st, under the title of "Considerations of Motor Car Elements," Mr. Hugh Dolnar criticises the design of speed indicator driving.

We are well aware of the difficulties connected with the driving of speed indicators from the front wheel, but we do not agree with Mr. Dolnar when he stated the rear axle as the initial point of drive fills all conditions.

The first instruments which we attached to motor cars were driven just as Mr. Dolnar suggests, by bevel gears (incased) and solid shafts, the drive being taken from the line shaft directly back of the change gear box. This drive would seem to be ideal, and we were very much surprised when the owners of these cars complained that the odometers did not always show the same distance between certain points. We investigated this carefully and found that the error was caused by the slipping of the rear wheels on mud and ice. One of these gentlemen while driving his car in the early part of the winter with a friend, overtook a farmer with a load of hay. As it was impossible to pass at that point, he slowed up and remained behind the load of hay. His friend suddenly remarked: "That farmer has a fine team; they can walk ten miles an hour." He answered: "Impossible. Why do you think they can walk ten miles an hour?" He replied: "Your Auto-Meter indicates ten miles, therefore, they must be going at that rate." As they both knew this could not be a fact, they investigated and found that the rear wheels were turning much faster than the front ones, the road at that place being covered with an inch or two of mealy snow.

After this experience we never attempted to drive from the rear wheels, as it was fully demonstrated that an accurate instrument must be driven from the front wheel.

Mr. Dolnar also states that an indicator could be sold for a lower price if there was not so much trouble with the drive; this is possibly true, but if driven as he suggests it would require an entirely different arrangement for every different make and model, and the cost would be greater than at present.

Our company has devoted a great amount of time and expense to the drive of the Auto-Meter, and we believe that we have as nearly perfect a drive as it is possible to make at the present time. By the use of self-cleaning spur gears on the wheel and a pair of hardened spiral gears enclosed in an aluminum case on the knuckle, and a swivel joint at the lower end of the shaft, which does away with bending of shaft when steering the car, we have eliminated most of the trouble which arises from ordinary use. We cannot, however, guard against accidents which wreck the wheel or axle and steering gear.

Mr. Dolnar says he does not know of one speedometer shaft which went through the Glidden Tour in good shape. This may be true, but the Auto-Meter had a good number which were in perfect condition and registered accurately at the end of the tour. The Auto-Meters on the following cars were in perfect condition: 10-11-13-14-16-17-25-27-29-33-37-39-44-48-49-51-52-54-58-60-90-100-106.

Yours very truly,
WARNER INSTRUMENT CO.

Stock Car Race Next Spring

At a recent meeting in Hotel Astor, October 15, of those interested in a stock tour car race over the highways, it was decided to hold such an event next spring. The event will be of international character and will be run under the sanction of the American Automobile Association, altho managed by the Metropolitan Automobile Association. Plans of organization offered by Mr. Morrell, ex-chairman of A. A. A., were agreed upon by those present. All conditions for the contest are to be determined by the Rules Committee. Those present were organized into a committee to inspect the various routes under consideration. and also other routes that were suggested at the meeting.

Germany Wins International Balloon Race

Pommern, the German contestant in the International long-distance balloon race starting from St. Louis, Mo., Monday, October 21, landed at Asbury Park at 8.45 A. M., Tuesday, October 23, after an aerial flight of 885 miles, thereby winning the first prize of the International Aeronautic Cup and a cash prize of $2500.

On Octobber 23, the last day of the St. Louis aeronautical carnival, Lincoln Beachy, of Toledo, Ohio, won a prize of $2000 with his four-cylinder gasoline propellor airship, sailing to the windward and return over a course of one and a half miles. He covered the course in four minutes and forty seconds.

Get descriptions of all 1908 cars by subscribing for the Journal, and having your subscription start with the June number in which the first 1908 car descriptions appeared. We have some of the last five issues on hand in which over fifty 1908 cars have been described, and will include them in new subscriptions as long as the supply lasts. Send $2 now, and be sure of these valuable numbers, as well as the December and future important numbers. Cycle & Automobile Trade Journal, Forty-ninth and Market streets, Philadelphia.

Bay State Gymkhana

The Bay State Automobile Association's second annual gymkhana held at the Newton Athletic Grounds, October 12, proved very successful. Walter Schmunk driving a White steamer won chief honors of the day, he having succeeded in capturing first place in four of the contests.

The contestants in the cigar race were required to start their cars at given signal, drive to a barrel stop, dismount, and take a match, remount and drive to another barrel, take a cigar and light it, and then drive once around the quarter-mile track.

Schmunk's time was 58 2-5 seconds, two seconds better than that of his nearest competitor. Mr. Schmunk also won the backward driving contest, circling the track in 44 3-5 seconds. Mr. Schmunk's third victory was in the barrel-touching event, in which he touched all the barrels in 2.13 1-5 seconds, and his fourth victory was the barrel knocking over contest.

The twelve-miles-an-hour was won by Harry W. Knights in Pierce Arrow. The brake test, in which contestants were required to stop on signal while moving at 15 miles an hour, was won by John L. Snow with his Peerless, which he stopped in 18 feet, 4½ inches. Ralph Coburn with a Maxwell was second, stopping in 21 feet 4½ inches. The obstacle race went to Ralph Coburn with his Maxwell.

Continual Increase in Exports

Exports for August, 1907, in automobiles and parts, show an increase of $39,391 in value over those of the corresponding month of 1906.

	August 1906	August 1907
Automobiles, and parts of	.....	.....
Exported to—		
United Kingdom	$122,630	$129,300
France	15,250	45,385
Germany	7,569	8,093

Nashville Meet

At a recent meet at the Cumberland Park course, Nashville, Tenn., Lewis Christie Strang, driving Walter Christie's racer covered a mile in 54 seconds.

The summaries: Two miles, open to touring cars; first heat—Joe Yowel's Pope-Hartford won. Time, 2.55.

Second heat—Won by Newman Hill's Pope-Hartford. Time, 3.00.

Third heat—Johnny Green, driving Oldsmobile runabout, first. Time, 5.04, for three miles.

Final heat—Wayne substituted for Oldsmobile, driven by Johnny Green, first. Time for five miles, 8.53.

Time of trial by Lewis Strang, driving Christie's car, .57, .55, .54.

Chicago Fall Meet

Chicago Automobile Club's twice postponed fall meet, was at last held at Harlem track on Saturday, October 12. Nine events composed the meet. The half hour race, reduced from an hour was won by 20 horse-power Cadillac, covering 23¾ miles. C. W. Van Sicklen riding an Indian, won the ten mile open, the ten mile handicap and the three mile open motorcycle events. Following are the winners:

Ten-mile open motor cylce race for machines of 30.65 cubic inches' capacity, standing start—C. W. Van Sickle. Indian. Time, 12.46.

Three-mile, free-for-all for cars, listing at $1,500 and under—R. L. Bartol, 15 H. P. Ford. Time, 4.40.

Five-mile race for runabouts or roadsters listing at $3,000 and under—George Farnsworth, 20 H. P. Cadillac. Time, 6.36.

Three-mile open motor cycle race for machines with 30.65 cubic inches' capacity—C. W. Van Sickle, Indian. Time, 3.49 4-5.

Five-mile Chicago Automobile Club members' race, contestant coming closest to 12 minutes for 5 miles to win—W. G. Lloyd, Jr., 20 H. P. Stoddard-Dayton. Time, 11.57 2-5.

Pursuit race for stock cars—Charles P. E. Schilpp, 45 H. P. Stearns six. Time for 4 miles, 3.58.

Ten-mile free-for-all, flying start—Charles P. E. Schilpp, 45 H. P. six-cylinder Stearns. Time, 10.22.

Half-hour race, reduced from 1 hour—George Farnsworth, 20 H. P. Cadillac, distance 23¾ miles.

Ten-mile motor cycle handicap—C. W. Van Sickle, 2.30, Indian. Time, 11.00.

Chicago's Proposed Three Day Run

A three days' reliability run covering 600 miles is the latest project of the Chicago Motor Club. The dates selected are Tuesday, Wednesday and Thursday, November 26, 27 and 28, during the week preceding the Chicago show.

The first day will be to South Bend, Ind., and back; the second day to Milwaukee and return, and the third day to Rockford, Ill., and return. Three classes will be provided, cars selling at $1,500 and under; cars at $1,500 to $3,000, and cars over $3,000.

Hartford (Conn.) Automobile Dealers' Association will hold their coming show in Foot Guard Hall, January 14-18.

Low rates to New York City, on all the principal railroads east of the Rocky mountains, including the Canadian provinces were secured by the American Motor League for its members during the automobile shows in New York City.

The show committee for the Importers Salon, to be held in Madison Square Garden, New York, December 28 to January 4, announces that it has found it necessary to utilize the entire Mezzanine balcony, as well as the platform to accommodate the accessory exhibits.

Two shows will be held in Detroit this season. The Detroit Automobile Dealers' Association will hold its show in Riverview Park Auditorium, December 9-16, and the Tri-State Auto & Sportsman's Association will hold a show at the Light Guard Armory, January 10-15, 1908.

The Early Automobile Show

For several years there has been an agitation among the members of the trade for an earlier show date, when the weather conditions are much more favorable and there is time for the manufacturers to prepare for early deliveries in the spring. The early date also allows many purchasers to obtain closed body cars for use during the winter months.

Altho many of the manufacturers were somewhat taxed to prepare for the show this year, it opened promptly on time with practically all exhibits complete and it is evident that in succeeding years, if the early date is adhered to, there will be no difficulty in preparing the exhibits by the latter part of October. As the cars change less and less each succeeding year there has been more agitation for the abolition of yearly models, and it has been advocated very strongly from certain quarters that the changes which are made be placed upon the cars as soon as perfected, regardless of the season. Altho this appeals to many, it is very evident that just as long as the public desire a yearly show the manufacturers will be more or less forced into reserving for first appearance at the show the new features which they are incorporating in their cars. The present automobile, contrary to the belief expressed by many, has not reached finality of design; the high wheel type of car is at the present time passing thru successive stages of evolution, and is destined more or less to effect the general design of the American automobile. In all probability several years will pass before these vehicles reach anything like finality of design, and their influence is already beginning to show in the design of the older and better known automobile types. Larger wheels are much in evidence, and particularly in the smaller and more medium priced cars the constructions are more nearly approaching high wheel designs. The clearance on all of the cars is somewhat greater than in previous years.

It was expected that the high wheeled vehicles were simply for the West—strictly a Western product, but anyone visiting the present New York Grand Central Palace Show could not help but be imprest by the number of high wheeled vehicles there shown. This is significant, as it points clearly to the fact that these cars are already entering the Eastern field, where it was considered they were not a necessity owing to the better condition of the roads in this part of the country as compared to the West. Even at the recent carriage show in New York, several vehicles of this type were shown, and from the records it will be found that many of them were sold to Eastern users.

Taking into consideration the changes which are shown at the present exhibit, it is very evident that for some years to come makers will be of necessity forced to have yearly models. However, the era of finality in motor car design is not far in the future, as is shown by the fact that many of the older established reputable firms have practically made no important changes for at least two and in some cases three years.

The Hand Writing on the Wall

It is matter of surprise to some at least, intimately connected with the production of American automobiles that so few of our well known manufacturers are reading "the handwriting on the wall" which only too clearly indicates the fact that the enormous field for commercial vehicles is almost ready for the harvest. In the construction of our pleasure vehicles there is no question but that many successful American manufacturers took their cue directly from European practice. If anything is clearly shown by European practice at the present time, it certainly is the fact, that commercial vehicles are not only rapidly increasing in numbers, but are in many cases considered an absolute necessity to the large houses of Europe. It is not unusual to see an entire block lined closely with gasoline de-

Hosted by Google

livery wagons belonging to a single concern, and it is a well known fact that these vehicles even in competition with the cheapest class of delivery are not only holding their own, but are showing an ever increasing balance on the right side of the ledger.

One line in particular has already shown itself to be of great value, namely the town cab. In Europe these vehicles are every day increasing in numbers and their popularity seems to be unabated. So far in this country very little attention has been given to gasoline cabs, and only one or two manufacturers are making any marked effort to prepare for the production of such cars. If the American manufacturer would follow as closely the trend in the commercial vehicle line as was done in connection with pleasure vehicles, it would be possible to place very soon upon the market trucks which would compare favorably with the product of many of the older concerns of Europe who have had several years experience in this line of building and the discrepancy in the time at which the Europeans and the manufacturers of this country started in the manufacture of the self-propelled vehicle would be largely made up.

The construction of commercial vehicles, as far as heavy work is concerned, is an entirely separate and distinct problem, to that of the manufacturer of the successful pleasure car, and much time and money are required to develop a reliable truck. In the field of light delivery the contrast in the commercial and pleasure vehicles is far less marked and the transition from the manufacture of one to that of the other is comparatively easy, but no greater mistake can be made than to attempt to apply to large trucks the same type of chassis which gives the most successful results as a parcel delivery vehicle.

Manufacturers of large European trucks are already investigating the American field and making preparations to place lines of their vehicles in this country, and unless the American manufacturers speedily prepare for the demand, which is already beginning to rapidly increase, they will not be ready to supply well tried and thoroly efficient vehicles, capable of competing with the cars from abroad, some of which have been tested in actual service for many seasons.

All the foreign automobile shows, like our own, are also scheduled earlier than usual this year. The show in Copenhagen, Denmark, runs from September 28th to October 7th. The big English show, held in the Olympia, London, is billed from November 11th to 23rd, and the rival show, the Stanley Show of London, opens in Agricultural Hall, November 22nd, closing November 30th. The Paris show, under the auspices of the Automobile Club of France, has its Exposition Decenniale de L'Automobile, in the Grand Palais, and Esplanade des Invalides, running from November 12th to December 1st. The German show in Berlin opens December 5th and closes December 22nd. The Italian show at Turin, Italy, opens January 18th and closes February 2nd.

Trade Journal's Information Bureau

The Cycle and Automobile Trade Journal in order to assist in making the shows more successful, will inaugurate an Information Bureau and an Appointment Bureau at their booth, located on the Main floor of the Grand Central Palace and in the Basement at Madison Square Garden, near the entrance in each case. Information can be secured as to the whereabouts of any person, and messages delivered or appointments made.

Italian Garden Effect for Madison Square Garden

The decorative scheme for the annual show of the Association of Licensed Automobile Manufacturers, in Madison Square Garden, November 2-9, has been decided on. The color scheme will be gray, crimson and white. The setting will be that of an Italian terraced garden. Altho there will be some statuary and staff work there will not be as much as last year, thus allowing more space and adding to the out of door feeling. There will be no starry sky overhead, but the girders of the big dome will be screened by a canopy of soft material of a rich warm gray tone.

Some twenty-five American makers will produce six-cylinder cars for the coming season. Eleven of these models will be shown at the Licensed Makers' Show in Madison Square Garden, New York. The lowest priced one costs $3,500, and the highest priced, $6,500.

This and the last issue of the Journal have dealt with the New York Shows. In the next issue we will describe all new things exhibited at Madison Square Garden not described in this issue, and in addition will publish a forecast of the Chicago Show. The succeeding issues will also have important features. The January issue will contain the Eighth Annual Buyers' Guide, the February number will be the Boston Show number, and the March number the Eighth Annual Complete Vehicle Review. If you are interested in the developments in the motor car industry, you cannot afford to miss any of these great features. To insure the regular receipt of the Journal send $2 at once for your subscription. Cycle & Automobile Trade Journal, Forty-ninth and Market streets, Philadelphia, Pa.

Hosted by Google

New York, October 24 to 31, 1907

As far as could be judged on the opening ening of the A. C. A. and A. M. C. M. Automobile Show, held in the Grand ntral Palace, New York, the interest d enthusiasm of the general public has t abated and has not been dampened the least by the early date. The usual stle and rapid work preceeding the ivate view in the afternoon of the 24th r the A. C. A. members and their friends, rned the chaos of partial exhibits, boxes, rniture, railings and decorations into a easing and orderly show exhibit. This resto" transformation is one of the most markable features of the New York itomobile Shows.

It is needless to state that the exhibitors both complete cars and accessories were mewhat pushed in order to have their w products in shape for this show, but was also noticeable that on the opening ening practically every exhibit was mplete with very few exceptions, in fact, e exceptions were even fewer than in evious years, and it is unquestionably ue that another year, with the present perience in view there will be no more fficulty in completing the models for ows at this early date, than was formerly perienced in getting ready for the mid-nter shows.

In spite of the financial flurry wh seems to have particularly affected N York City, the buying public and th who showed by their evident interest the various models that they were inte ing to purchase, were out in force.

Altho the scheme of decorations is in any way elaborate, yet it is of such nature that the building has been tra formed without the fact being too pro nent or calling attention particularly the decorations. The general effect that of autumn scenes, this being produ by a lavish use of branches and ma tinted autumn leaves. The posts and ot portions which would otherwise be trusive, have been neatly covered in d green, and each exhibit is carpeted in s able red, while the divisions between hibits consists of brass posts with gr rope tretched between. The signs uniform in gold, white and brown. At end of the main aisle, as usual, the c emblem blazes forth in immunerable e tric lights, adding a pleasing glow to entire scene at night. On the whole, show looks extremely business like the information obtained at this ea writing, from the exhibits as would t to bear out in fact, this appearance.

A large part of the space in the build

The Changes of a Year

Iot since the early days of the indus- has there been such diversity as ap- rs at the "Palace" show, and yet this ersity, unlike the diversity of old, is a groping after something unknown; is the expression of a definite purpose no longer cater to a single class, but supply the variety of needs that diver- ed tastes require. Proof of this is inly seen in the fact that many cars w no change whatever except possibly ior refinements; while by their side m the same factory is a widely differ- construction in an entirely new model another class of trade. It is partic- rly true that those makers who have the largest measure of success in the t have been most careful not to nge and jeopardize that success by un- ven radical features. This policy is t also for the buyer, for he knows t the article he buys is not a ques- nable one to be tested at his ex- se, but that it is just what it is rep- ented to be and that he can depend on ting just what he bargains for. And s is as it should be, a sane condition the business. It betokens the passing the fad and the entry of the auto into ctical usefulness rather than, as in the t, largely a thing for ostentation.

n general the changes fall into four sses, viz., limousines, runabouts and gies by shape; and six cylinder-mo- ed when classified by this feature. The rease in the representatives of these sses is evident at once. But the diver- goes even further. It may be seen n the high priced Glide, Chadwick, Na- driven into said bonnets, mark two e tremes of the runabout class. Yet bo have their market with neither maker i terfering with the other. Between the extremes are many fine examples of th class. The friction drive Lambert is o and is doubly interesting because for many years its designer has firmly sto by his belief in this form of drive. Em nating from the Mississippi valley, it h slowly worked eastward and has at la won a place alongside the geared c even in rough and bad roads where was formerly predicted this drive wou fail. That it has not failed simply prov that everything has a place and is right in that place if properly design and built. Counting the motor buggi the increase in this form of drive ov previous shows is remarkable. The E ansville and the Cartercar are exampl of the application of the friction type drive to more expensive runabouts whi the Gearless depends on friction in slightly different form, the surfaces he being true rolling cone surfaces and t rollers simply taking the place of plan tary gears. The Ford runabout is we known, but the Brush is new to many a has a number of new features; its spir springs, solid tires and left side contr all being noticeable at a glance. The ha dozen motor buggies really require a se arate description, for they are really a class by themselves, altho much mo strictly runabouts than many speed ca so called. The pioneer Holsman is amo the number and the variations of its f lowers show in many points the mot car influence frequently to the detrime

ain that the horse vehicle having given tisfaction for generations may be a safe ide.

In touring cars generally, there may noticed much refinement. Better hous- g of the gears; simplification of the oil- g system, doubling of the sparking sys- m from the plugs to the electric source, e use of magnetos, lower hung bodies d increased wheel sizes are all in evi- nce. A number of frames are raised er the rear axle, not with a mere trace a curve or taper but with a bold rise six or more inches. In the American e entire frame is underslung and hangs om the half elliptic springs instead of sting upon them. The effect at first ght is odd, yet it is not freakish, and sitors pass by it without noticing that is other than a low hung chassis. It rtainly gets the weight low and should a valuable contribution to speed and fety over bad roads. It rather con- ibutes to accessibility, for the frame annels are below the mechanism in- ead of above it, and so are more out the way. Better fan mounting, posi- ely driven centrifugal pumps, larger diators, larger exhaust pipes and muff- rs, larger brakes and clutches are in ev- ence. In fact it is beginning to be evi- nt that the brake matter may be over- ne and that there is no more need for plication of brakes to insure certainty an for the duplication, for example of past for "emergency brakes" should been met by better quality instead of greater quantity. The lesser number mits the costs of both making and ma taining to be less, and that is a thing moment to both maker and user. Weig have been reduced in may places with creased power and efficiency; the bet steels available have contributed to p of this and better designs to the mainder. The motor has been much proved by housing many of its parts, often by putting the valves in the h and by the use of an overhead shaft wh it is not housed. The overhead sh avoids the use of a lot of push rods, it is certainly much better to run a sin drive to the top of the motor than ma rods, altho the lubrication of the o shaft adds itself to the opposite side the balance. Three quarter platfo springs tend toward easier riding an saving of tires and seem to be gain Quick detachable tires seem to have m more progress than removable rims. M guards are more continuous than ever, in many cars practically exclude n from below, being continuous from side of the car to the other and join both running boards to the frame, guards curved in cross section are ga ing. Much more could be said did sp permit, but in short, refinement of det and adaptation of the product to varied needs of the market is the keyn

Hosted by Google

Significant Exhibits

HIGH WHEEL CARS.

he only high-wheel car shown at the ace in 1907 was the Holsman, opposed -inch cylinders, 12 H. P. motor, d tires, wheels 44 inches front and 48 nes rear, one model only, 3 passengers one seat, price $750. This was the t appearance of a high wheel car at Iew York show, tho the Holsman had n in successful manufacture since 1902 sold about 1 000 cars in 1906.

he unexpected 1907 show event came Chicago, where some eight or ten dif- ent high wheel models, previously un- wn to the public, were on view.

he present 1908 Palace exhibits display less than seven different exhibitors of h wheel cars, showing a large number different models of two and four pas- ger bodies, priced at from $400 to 00. This very striking development exploitation of the low priced, high eel car must be regarded as the most lly significant of all the indications of 1908 Palace Show. All of these high eel cars have horizontal opposed cylin- motors and all or almost all of them air cooled. Very large numbers of high wheeled cars will be built in 8, making motorists of many thousands farmers who have before been bitter onents of the automobile; and creat- a local demand for good roads hith- unknown.

is not too much to say that the high eel car is the most potent agent of tor car advance, motor car price reduc- and motor car popularization in evi- ce at the Palace Show, and that from far-sighted point of view, the high in motor car design and construction muc more distinctly than the licensed associ tion display, which exhibits progress alon conservative lines closely constrained b precedent and conventional tradition.

Granting the truth of this broad stat ment, the Palace Show exhibits indica a yet existent belief in the value of stea for motor car driving, a very rapid in mediate increase in the employment the 2-cycle motor, a greatly increased us of air cooling, the probable adoption the hammer spark and magneto ignitio and an enormous production of high whe cars which must surely work towards pri reductions in all grades of cars now so at $2,000 and under, besides hasteni the day of good roads and of the frien liness of the farmer towards the mot car.

AIR COOLING.

The Marmon car exhibit, by the No dyke-Marmon Company, includes a wat cooled motor at this 1908 show, tho u to this time the Marmon motors ha been exclusively air cooled.

The Marmon Company shows thr models, Model H, a 5 or 7 passenger tou ing car, motor four cylinders, 5x5, tande 4-cycle, water cooled, 45 H. P., or four c linders, two set at 90 degrees to the oth two, 45 degrees each side of vertica plane, a 5x4½ inches, 40 H. P. air coole this chassis is also fitted with a 3 or passenger roadster body. The third Ma mon car is Model G, a 5 passenger ca 104 inches wheel base with the same fou cylinder air cooled motor, 40 H. P., spe ified as alternatively fitted to the Mod H chassis.

It will be seen from this list of Marm 1908 cars that the Marmon engineers ha not yet relinquished their preference f

ate the superiority of air cooling.

While several low wheeled cars changed om air cooled to water cooled motors 1907, this seeming turn towards the nal exclusive use of water cooling is far ore than met by the great numbers of r cooled motor driven high wheel cars hich will be made and sold in 1908.

These air cooled high wheelers all cool e cylinders well, and the good 1908 perormance of many thousands of air cooled pposed cylinder motors cannot fail to reatly influence the cylinder cooling ethods of car motors in general.

It is well known that water cooling inludes many vexatious features, and that ome of the four vertical cylinders airooled motors are wholly satisfactory to eir users.

THE 2-CYCLE MOTOR.

The 1907 Palace exhibit included one ngle example of the 2-cycle motor aplied to car driving shown by the Atlas ompany.

This 1908 show has 2-cycle motor driven rucks by the Reliance Company of Deroit, with two, three and four 5⅛x5 ches cylinders, 2-cycle, water cooled, espectively 30, 45 and 60 H. P. This ne of trucks has been developed since 904, and the present Reliance exhibit inludes three models of trucks, respectively f 2, 3 and 5 tons paying load capacity.

The advantages of the 2-cycle motor for ar driving are specified by Mr. Wilcox, of e Reliance, as (a) simplicity, (b) closer pproximation to uniform torque, (c) reability, (d) low first cost and (e) lower el consumption for equal work than the our-cycle motor.

tor was materially modified before be very successfully used in the Atlas runabout, of which 300 were ordered that season.

For 1908 the Atlas Company sh three 2-cycle motor driven models, passenger touring car, four cylind 4½x4½ inches water cooled, 44 H. two or four passenger runabout driven three 2-cycle cylinders, 33 H. P., an two passenger, two-cylinder runabout, H. P.

In addition to these two-cycle m passenger cars the Atlas Company off but, because of space limitations does exhibit, two trucks, 2 and 4 tons pay load capacity, both driven by two-cy der, 2-cycle motors, 22 H. P., makin line of five models of 2-cycle motor dri cars for 1908 as compared with tw cycle models shown by the Atlas Comp at the Palace in 1907.

Mr. P. A. Williams, Jr., of the A Company, says that the success of Atlas 2-cycle motor is due to simpli larger power for weight, reliability low up-keep cost because of the abse of valves and the valve motion, known to require constant attention the 4-cycle motor.

THE HAMMER SPARK.

The 1908 Garford shows two motor cylinders, 4-cycle and water cooled, 4¾x5¼ inches, 45 H. P., and the o 4⅛x5¼ inches, 35 H. P., both with h mer-spark ignition, magneto current ply only, with no prudential placing storage battery or dry cells. This me of course, stoppage in case of magn failure. The Sims-Bosch magneto, u

dvantages. The magneto is, mechanily, the simplest electric current sup- which serves well for gas engine igni-n. The hammer-spark gives the great- range of motor speeds, as it will ignite charge containing less fuel than the st which can be ignited at the same npression by the jump spark. The Gar-d and the Studebaker use this same nmer spark producing assemblage, with battery and no coil, all constituting the plest possible ignition system and ob-ning, also, the greatest motor flexibil- with a given maximum compression. s placing of the hammer spark in these tors, with magneto current supply only, nighly significant, as it shows how bat-y, coil and spark-plug delays and an-vances may be well avoided.

'he Gaeth cars, a 5 or 7 passenger ton-u body and a 3 passenger runabout, h on the same chassis model, four inders, 4⅞x5¼ inches, 4-cycle, water led, 35 H. P., fits a hammer spark as-ably, Sims-Bosch low tension magneto, h dry cells as an auxiliary reserve, no , Gaeth's patented, single-shaft ham-r spark action.

aeth specifies the hammer spark ad-tages as including (a) greater proba-ty of ignition, (b) greater motor flex-ity and (c) greater motor power, as npared with the jump spark. The th hammer spark action is an extreme-simple and very elegant movement.

he Rainier shows 3 models of bodies, ring car, limousine and landaulet, all one chassis model, with four cylinders, ¼ inches, 4-cycle, water cooled, 50 H. hammer spark, Sims-Bosch low tension gneto, no coil and no auxiliary battery. s hammer spark action is a new de-

jump-spark are reliability, greater flexib ity of motor power and greater maximu H. P., same piston area and compressio

These two examples of the hamm spark with low tension magneto and wit out the coil, are highly significant exh bits because the 1907 Palace exhibiti showed only one example of hammer spa ignition, while this 1908 display includ three wholly different hammer spark a tions, each one perfect in operation, a each offered with the utmost confiden as superior to the jump-spark.

HUGH DOLNAR.

The Air Ship Exhibit

Aero Club of America have an exhib on the fourth floor showing a number the latest devices in Aero planes, A ships, Flying machines, special baske for baloons and paraphanalia including a cessories and hampers. Included in th exhibit are a number of very light engin for use on the various machines. Tho particularly worthy of note are an cylinder produced by Mr. Peter Coop Hewitt of the Hewitt Motor Co., in whic the cylinders are set 90 degrees apa four in a row, the Francis air ship engi a French production, exhibited by t Prospect Motor Mfg. Co., of Brookly N. Y., the well known Curtis air cool engine in one, two, four and 6 cylinde and two new engines exhibited by t Aero and Marine Motor Co., 60 Lebert Square, Boston, one of which is a 4-cyli der, 2-cycle water-cooled, 40 H. P. a the other is a 9½ H. P. 2-cycle air-cool 4 cylinders weighing 35 pounds.

Summary of the Shows

We give on the succeeding pages a brief but complete summary of the exhibits at both the Grand Central Palace and Madison Square Garden Shows, and in this issue we describe a very large proportion of the new cars and accessories shown, but as only two days were available for the gathering of these descriptions and illustrations, it was impossible to include full detail descriptions of all in this number, and as we did not wish to print any incomplete description, without adequate illustrations the balance have been held over for our next issue the "3rd show number," and our readers will then have full detail descriptions of everything new.

Cars at the Grand Central Palace

ANDERSON CARRIAGE CO., Detroit, Mich.—Two electric enclosed body models for town service.

ABENDROTH & ROOT MFG. CO., Newburgh, N. Y.—Frontenac 7-passenger limousine, 4 cylinders, 4¾x5, 40-45 H. P., $5000; Frontenac, 7-passenger car, 4 cylinders, 4¾x5, 40-45 H. P., $4000; Frontenac 3-passenger runabout, 4 cylinders, 5x5, 40-45 H. P., $4000. Described in this issue.

ACME MOTOR CAR CO., Reading, Pa.—Acme Model 16, 4-cylinder touring car, 4½x5, 30 H. P., $3500; Model 18, 4-cylinder touring car, 4½x5, 30 H. P., $4000; Model Sextuplet, 6-cylinder touring car, 4½x5, 45 H. P., $4600. To be described in our next issue.

ATLAS MOTOR CAR CO., Springfield, Mass.—Atlas Model R, 2-cylinder, 2-cycle runabout, 4½x4½, 20 H. P., $1400; Model D, 3-cylinder, 2-cycle runabout, rumble seat, 4½x4½, 34 H. P., $1900; Model E, 4-cylinder, 2-cycle touring car, 4½x4½, 46 H. P., $2400. To be described in our next issue.

AUSTIN AUTOMOBILE CO., Grand Rapids, Mich.—Model LX-T touring car, 4 cylinders, 5½x5½, 60 H. P., $4500; Model LX-C touring and runabout, 4-cylinder, 5½x5½, 60 H. P., $4500; Model LX touring and limousine, 4 cylinders, 5½x5½, 60 H. P., $5500; Model XC-T 6-cylinder touring car, 5½x5½, 70 H. P., $6000; Model XC-T 6-cylinder, touring and runabout, 5½x5½, 90 H. P., $6000; Model XC-C 6-cylinder touring and limousine, 5½x5½, 90 H. P., $7000. To be described in an early issue.

AMERICAN MOTOR CAR CO., Indianapolis, Ind.—American Tourist, 4-cylinder, 5x5, 40 H. P., $3200; Model "40," 4-cylinder roadster, 5x5, 40 H. P., $3250; Model "50," 4-cylinder tourist, 4¼x5½, 50 H. P., $4000; Model "50," 4-cycle roadster, 5¼x5½, 50 H. P., $3750. To be described in an early issue.

THE BARTHOLOMEW CO., Peoria, Ill.—Glide Model G touring car, 4 cylinders, 4½x5, 36-40 H. P., $2500; Glide Model 45, special 5 or 7 passengers, 4 cylinders, 4¾x5, 45-50 H. P., $3000; Glide Model H, 5 or 7 passengers, 6 cylinders, 4½x5, 54-60 H. P., $5000. To be described.

BRUSH RUNABOUT CO., Detroit, Mich.—Model 1 A, seats two, single vertical cylinder. 4x4, 6 H. P., $500; Model 1 B, seats two, one vertical cylinder, 4x4, 6 H. P., $550; Model 1 C, package cart, one vertical cylinder, 4x4, 6 H. P., $550; Model 2 A, detachable tonneau, two or four passengers, two vertical cylinders, 4x4, 12 H. P., $800; Model 2 B, delivery wagon, 2 cylinders, vertical, 4x4, 12 H. P., $800. To be described in our next issue.

THE BUCKEYE MFG. CO., Anderson, Ind.—Lambert Model 18 runabout, 2-cylinder, horizontal, 4x4, 18 H. P., friction change speed, $800; Lambert Model S touring car, 2-cylinder, horizontal, 6x4½, 24 H. P., $1275; Model M touring car, 4 cylinders, 4½x5, 35-40 H. P., $2000; Model R touring car, 4 cylinders, 4½x5, 35-40 H. P., $2500. To be described in an early issue.

CAMERON CAR CO., Brockton, Mass.—Model 8, 4-cylinder touring car, air-cooled, 3⅝x3½, 16 H. P., $1050; Model 6, two-passenger roadster, same chassis, except 10 inches shorter wheel base, $850. Described in this issue, page 96a.

CARTER MOTORCAR CORPORATION, Washington, D. C., and Detroit, Mich.—Two models, similar chassis; two 4-cylinder air-cooled engines, vertical under hood at front, 4x4, 60 H. P., with touring bodies and complete equipment, including top, $3500.

CLEVELAND MOTOR CO., New York.—Three 1908 models, similar chasses, 4 cylinders, 5x5, 40-45 H. P., touring car, $3500; 40-43 H. P., runabout, $3500; also a polished chassis and a 1907 car with special Demerest landaulett body, $5500. New features, differential transmission and brakes, to be described in an early issue.

COLT RUNABOUT CO., New York and Yonkers.—40-50 H. P., 6-cylinder, 4½x5, $1750; gentlemen's roadster body, with mechanian's seat on running board. Described in the August, 1907, issue, page 96.

CHADWICK ENGINEERING WORKS, Philadelphia, Pa.—Chadwick "Six" tourabout, 6 cylinders, 5x6, 50 H. P., seating capacity 3, $5500; Great Chadwick Six, 50 H. P., touring car, seats 7, 6 cylinders, 5x6, $5500. Described in the June issue, page 102.

CONTINENTAL AUTO MFG. CO., New Haven, Conn.—Model A runabout, seats 3, 4 cylinders, 4½x4¾, 20 H. P., $2400; Model B runabout, rumble seat, 4 cylinders, 4½x5¼, 35 H. P., $2700. Described in this issue, page 88a.

CRAWFORD AUTOMOBILE CO., Hagerstown, Md.—Model E touring car, 5 passengers, 4 cylinders, 4½x5, 35 H. P., $2500; Model C, 5-passenger touring car, 4 cylinders, 40 H. P., $3000; Model D, 3-passenger runabout, 4 cylinders, 4½x5, 35 H. P., $2500; Model F, touring or limousine, 7-passenger, 4-cylinder, 5x5½ 50 H. P., $3750. Described December, 1906, page 92.

DAYTON MOTOR CAR CO., Dayton, Ohio.—Model 8 G, 6 cylinders, 4⅝x5, 50-60 H. P., $4500; three models on the 30-35 H. P. chassis, 4 cylinders, 4⅜x5; Model 8 K roadster, $2500; Model 8 F touring car, $2500; Model 8 F limousine, $3500; Models SN and 8-H, an 18 H. P. chassis, 4 cylinders, 3⅞x3¾; SN is a laudaulet, $2500; 8-H, runabout, $1700. To be described in an early issue.

DE LUXE MOTOR CAR CO., Detroit, Mich.—50 H. P., 7-passenger limousine, 4 cylinders, 5x5¼, $6250; 50 H. P. landaulette, 4 cylinders, 5x5¼, $6250; 50 H. P., 7-passenger touring car, 4 cylinders, 5x5¼, $5000; 50 H. P. runabout 4 cylinders, 5x5¼, $5000. To be described in an early issue.

DORRIS MOTOR CAR CO., St. Louis, Mo.—Model C, 6-cylinder touring car, 4¼x5, 30 H. P. No price stated. Model C, runabout, seats 3, 4 cylinders, 4¼x5, $2500; Model C, 30 H. P., touring car, seats 4, 4 cylinders, 4¼x5, $2500. To be described in an early issue.

DRAGON AUTOMOBILE CO., Philadelphia, Pa.—24-26 H. P. Touring Car, 4 Cylinders, 4x4½, $2100; 35 H. P. roadster, 4 cylinders, 4½x4½, $1850. To be described in our next issue.

ELLSWORTH, J. M., 518 West Thirty-second street, New York City.—The Ellsworth car described in this issue, page 74.

EVANSVILLE AUTOMOBILE CO., Evansville, Ind.—Two models on the same type 4-cylinder chassis, 4⅜x5¾, 28-30 H. P. friction change speed, Model C limousine, $3500; rumble seated roadster, $2500. Described in the August, 1906, issue, page 118.

EAGLE MOTOR CO., representing the Compound Car Co., Middletown, Conn.—Three models, same chasses, compound engine, high pressure cylinder, 4x4½, low pressure cylinder, 7x4½, 20 H. P.; Model M, 5-passenger touring car, $2000; Model O, 4-passenger touring car, $1800; Model P, 2-passenger runabout, rumble seat if desired, $1600; all models equipt with tops. Described December, 1905, page 122.

FORD MOTOR CAR CO., Detroit, Mich.—6-cylinder touring car, 4¼x4½, $3000; same chassis with runabout body, $2800; Model S, 4-cylinder runabout, 3¾x3¾, $700; same chassis with runabout body without running boards, $600. Prices stated are subject to change. To be described in next issue.

GARFORD MOTOR CO., New York.—Garford 40 H. P., 4 cylinders, 4¾x5½, $4000; Garford 30 H. P. touring car, 4 cylinders, 4⅛x5¼, $3500; 40 H. P. runabout, 4-cylinders, 4⅛x5¼, $3500; 40 H. P. runabout, 4 cylinders, 4¾x5½, $4000; 30

Hosted by Google

H. P. runabout, 4⅛x5¼, $3500. Described on page 166, this issue.

GAETH AUTOMOBILE CO., Cleveland, Ohio.—Model 44, 7-passenger car, 4 cylinders, 4⅞x5¼, 35 H. P., $3500. Described in the December, 1906, issue, page 164. K, delivery wagon, 1 cylinder, horizontal, 5¾x7, 12-14 H. P., $1500. Described in the September, 1906, issue. page 186.

GEARLESS TRANSMISSION CO., Rochester, N Y.—60 H. P., 5-passenger car, 4 cylinders, 5x5¾, friction change speed, planetary type, $3500; 75 H. P. touring car, 6 cylinders, 4 13-16 x 5½, seats 7, friction change speed planetary type, $4000; Gearless Grayhound, 6 cylinders, 4 13-16 x 5½, 75 H. P., friction change speed, planetary type, $4000. Described in the September, 1907, issue, page 118.

HATFIELD MOTOR VEHICLE CO., Miamisburg, Ohio.—Hatfield Buggyabout, high wheel type, motor, 2-cylinder opposed, air-cooled, crosswise under body, friction drive with floating rest, 12 H. P., 4 1-16 x 4, $650. Described in this issue, page 144.

HOLSMAN AUTOMOBILE CO., Chicago, Ill.—Two models, same chasses, except for wheel base; high wheeled type, double opposed air-cooled motor, lengthwise under body, 4x4, 12 H. P.; Model 11, surrey type, $800, without top; Model 10, runabout, $750, without top. Five demonstrators on the street; Model H described in our February, 1907, issue, page 262.

IMPERIAL MOTOR CAR CO., Willamsport, Pa.—Model 2, seating 3 passengers, 4 cylinders, 4½x5¼, 30-35 H. P., $2500; Model 2, seating 4, 4 cylinders, 4½x5¼, 30-35 H. P., $2650. To be described in our next issue.

JACKSON AUTOMOBILE CO., Jackson, Mich.—Model C touring car, 2 cylinders, horizontal, 5¼x5, 20-24 H. P., $1250; Model D touring car, 2 cylinders, horizontal, 5¼x5, 20-24 H. P., $1500; Model E touring car, 4 cylinders, 4½x4¾, 35 H. P., $2000; Model E gentlemen's roadster, 4 cylinders, 4½x4¾, 35 H. P., $2000. Described in this issue, page 83a.

KIBLINGER, N. H. CO., Auburn, Ind.—Model E, high wheel type, two-cylinder opposed, air-cooled, lengthwise under body, 4¾x4¾, 9 H. P., $487.50, including complete equipment and top. One demonstrator. Described in our September, 1907, issue, page 106.

KISSEL MOTOR CO., Hartford, Wis.—40 H. P. limousine, 4-cylinder, 4¾x4¾, $3200; touring car, 5 or 7-passengers, same chassis, $2000, or with complete equipment, $2200; also polished chassis. Described in our October, 1907, issue, page 164.

KLINK MOTOR CAR MFG. CO., Dansville, N. Y.—5-passenger touring car, 4 cylinders, 4¼x 4¾, 30 H. P., $2000; runabout, same chassis, $2000. Described October, 1907, page 142.

KINGSTON MOTOR CAR CO., Kingston, N. Y.—Allen Kingston models all have the same motor, 4 cylinders, 5x5¾, 45-50 H. P.; Model E, limousine, $5300; Model D runabout $3900; and Model F, $5500. To be described in our next issue.

LANE MOTOR VEHICLE CO., Passaic, N. J.—7-passenger steam touring car, 30 H. P., Lane type tubular boiler, engine compound condensing; high pressure cylinder 3⅞, low pressure 3¼, $3100; high power roadster, same chassis, except the wheel base, which is 7 inches shorter than the touring car, $2800; 5-passenger touring car, small general design, 20 H. P., high pressure cylinder 3¼, low pressure cylinder 5¼, stroke 3½, $2000; runabout on same chassis, $1800. Special features—runabout throttle control on stationery sector over steering wheel, similar to that of gasoline cars. No hand pumps necessary for either water or fire control. Described in the May, 1907, issue, page 67.

LANSDEN CO., Newark, N. J.—Closed pannel body electric delivery wagon; capacity, 750 pounds; Edison battery, $2450; open top express, 1000 pounds capacity, Edison batteries, $2250; electric tonneau, 5-passenger car, on gasoline lines; solid tires and body suspended on coiled springs; Edison battery; undershung and controller under the hoods, $5000. First time shown. To be decsribed in an early issue.

LOGAN CONSTRUCTION CO., Chilicothe, O.—Model R, 4-cylinder air-cooled delivery wagon, 1500 pounds carrying capacity, 4x4, 20 H. P., $1800; Model T, one-ton truck, 4 cylinders, air-cooled, under seat at front, 4x4, 20 H. P., $2250; Model S, three-tons, 4 cylinders, water-cooled, 40 H. P., 4¾x5, $3500. Three demonstrators, Model S, Model T, and Model O. To be described in an early issue.

OSCAR LEAR AUTOMOBILE CO., Springfield, O.—50 H. P., 7-passenger touring car, 4 cylinders, air cooled by Frayer-Miller blower system, 5½x5½, $3500, fully equipt; 5-passenger touring car, 4 cylinders, 24 H. P., 4 1-16 x 5⅛, $2750; convertable runabout, 4 cylinders, 4 1-16 x 5⅛, 24 H. P., $2500; gentlemen's roadster, same chassis, $2250. Described in our January, 1907, issue, page 116.

MOLINE AUTOMOBILE CO., East Moline, Ill.—Model H touring car, 2 cylinders, horizontal, 5x5, 18 H. P., $1250; Model S touring car, 4 cylinders, 3⅞x4½, 24 H. P., $2000; Model A touring car, 4 cylinders, 4½x5, 35 H. P., $2500. Described in this issue, page 93a.

MOON MOTOR CAR CO., St. Louis, Mo.—Model C roadster, 4 cylinders, 4½x4½, 30-35 H. P., $3250; Model C touring car, 4 cylinders, 4½x 4½, 30-35 H. P., $3500; Model D touring car, 4 cylinders, 4½x4½, 30-35 H. P., $3750. To be described in an early issue.

THE MORA MOTOR CAR CO., Rochester, N. Y.—Racytype "6" runabout, with and without rumble seat, 6 cylinders, 4x5⅛, 45 H. P., $2500; Tourer "6," touring car, 6 cylinders, 4x5⅛, 45 H. P., $3600; Racytype "4" runabout, with and without rumble seat, 4 cylinders, 4x5⅛, 24 H. P., $2350; Tourer "4," touring car, 4 cylinders, 4x5⅛, 24 H. P., $2500. Described in this issue.

MOTOR CAR CO, Detroit, Mich.—Carter car, Model A, touring car, 2 cylinders, opposed, 5½x 4½, 22-24 H. P., $1350; Model C, delivery wagon, 2 cylinders vertical, 5½x4½, 22-24 H. P., $1350; Model D runabout, seats 2, 2 cylinders opposed, 5½x4½, 22-24 H. P., $1250; Model E, with Dayton folding tonneau, 2 cylinders, opposed, 5½x4½, 22-24 H. P., $1350; Model F, detachable tonneau for 2 or 5 passengers, 2 cylinders opposed, 5½x4½, 22-24 H. P., $1350. Described in this issue.

MACK BROS. MOTOR CAR CO., Allentown, Pa.—Trucks and sight-seeing cars, practically all with the same chassis specifications; 4-cylinder motor, 5½x6, vertical at the front, 50 H. P.; 12-passenger car, $4800; 20-passenger car, $5500; 22-passenger car, $6500; two-ton truck, $3800; three-ton truck, $4300; five-ton truck, $5100. To be uescribed in the next issue.

MARION MOTOR CAR CO., Indianapolis, Ind.—Model A-8, 6-cylinder, 3x3, 32-35 H. P., seats 2, $2500; Model 8, 4-cylinder touring car, 4x4, 24 H. P., $2250; Model 8, seating capacity 3. 4 cylinders, 4x4, 24 H. P., $2250.

MAXWELL-BRISCOE MOTOR CO., Tarrytown, N. Y.—Model LC runabout, double opposed motor, 4½x4, 12-14 H. P., $825; Model NC runabout, double opposed motor, 5x5, 16-20 H. P., $1350; Model HC touring car, double opposed, 5x5, 16-20 H. P., $1450; Model D touring car, 4-cylinder, 4¼x4½, 24-26 H. P., $1750; Model M, 5-passenger touring car, 4 cylinders, 5x5, 40 H. P., $3000. Described in the September, 1906, issue, page 105.

MITCHELL MOTOR CAR CO., Racine, Wis.—Model H runabout, 4 cylinders, 4x4, 20 H. P., $1000; Model G, rumble seated runabout, 4 cylinders, 20 H. P., $1250; Model I touring car, 4 cylinders, 4½x5, 35 H. P., $2000; 35 H. P. L limousine, 4 cylinders, 4½x5, $2800. Described in this issue, page 108.

NATIONAL MOTOR VEHICLE CO., Indianapolis, Ind.—Model T, 7-passenger touring car, 6 cylinders, 5x5, $5000; Model R roadster, 6 cylinders, 5x5, $4200; Model R, 7-passenger car, 6 cylinders, 4½x4¾, $4200; Model K, 7-passenger car, 4 cylinders, 4⅞x5, $3500; Model N roadster, 4 cylinders, 5x5, $3700; Model N, 7-passenger car, 4 cylinders, 5x5, $3700. To be described in an early issue.

NORDYKE & MARMON CO., Indianapolis, Ind.—Model H, air-cooled, 4-cylinder, V-type motor, 5x4½, 35-40 H. P., $3500; Model G touring car, 4-cylinder, V-type motor, 5x4½, 35-40 H. P., $3000; Model H, water-cooled touring car, 4 cylinders, 5x5, 40-45 H. P., $3500; Model H roadster, water-cooled, 4 cylinders, 5x5, 40-45 H. P., $3500. 1908 models to be described in an early issue.

OVERLAND AUTO CO., Indianapolis, Ind.—Model 9 runabout, 4 cylinders, 3½x4½, 22-24 H. P., $1250. To be described in an early issue.

PENNSYLVANIA AUTO MOTOR CO., Bryn Mawr, Pa.—Model C, 4-cylinder touring car, 4¾x5¼, 50 H. P., $3000; Model C roadster, 4 cylinders, 4¾x5¼, 50 H. P., $2800. Described in this issue, page 134.

Hosted by Google

PIERCE ENGINE CO., Racine, Wis.—Model D touring car, 4 cylinders, 4½x5½, 40 H. P., $3000; Model E touring car, 4 cylinders, 4¼x5, 30 H. P., $2000. To be described in an early issue.

PREMIER MOTOR MFG. CO., Indianapolis, Ind.—Model 45, 6 cylinders, 4½x4½, 45-55 H. P., $3750; Model 30, 4 cylinders, 4½x4½, 30-35 H. P., touring or runabout bodies, $2500; Model 24, 4 cylinders, 4¼x4¼, 24 H. P., touring and runabout bodies, $2250.

PULLMAN MOTOR CAR CO., Chicago, Ill.—Model 16 runabout, 4 cylinders, 5½x5½, 55 H. P., $3750; Model 15 touring car, 4 cylinders, 5¼x5½, 55 H. P., $4000; Model 17 touring car, 6 cylinders, 5¼x5-..., 70 H. P., $5000. Described February, 1907, page 200.

RAPID MOTOR VEHICLE CO., Pontiac, Mich.—Eight models, E-62, one-ton truck, 2-cylinder, horizontal, 5x5, $1600; Model E-21, one-ton, 2-cylinder, horizontal, 5x5, 24 H. P., $1600; Model E-11, full paneled body, double opposed 2-cylinder motor, 5x5, 24 H. P., $1650; Model E-132, passenger vehicle, capacity 12, double opposed motor, 5x5, 24 H. P., $1800; Model E-152, 16-passenger wagonette, 2 cylinders, horizontal, 5x5, 24 H. P., $2000; Model E-44, 1½ tons, 2 cylinders, horizontal, 5¼x5, 24 H. P., $2000; Model E-222, one-ton, 2 cylinders, horizontal, 5x5, 24 H. P., $2400; Model 2-182, 12-passenger wagonette, 2 cylinders, horizontal, 5x5, 24 H. P., $4000.

RELIANCE MOTOR CAR CO., Detroit, Mich.—Model K, 4 tons, 4 cylinders, 5⅛x5, 60 H. P. $4400; Model H, 2 cylinders, vertical, 2-cycle, 5⅛x5, 30 H. P., one to three tons capacity, $2750; Model H, 3 to 4 tons, 3 cylinders, 2-cycle, 5⅛x5, 45 H. P., $3500.

REO MOTOR CAR CO., Lansing, Mich.—Model A, 18-20 H. P., 2-cylinder, opposed, $1250; Model B, 8-10 H. P., single cylinder, horizontal under the body $650; Model C, 18-20 H. P., 2-cylinder, opposed, roadster shown for the first time, $1000. Described in this issue, page 176.

RAINIER MOTOR CAR CO., factory Saginaw, Mich.; offices Fiftieth street and Broadway, New York.—Limousine, 4-cylinder, 45-50 H. P., 5x5¼, $5750; same chassis, 7-passenger touring car, $4500, or with runabout body, $4300

SCHACHT MFG. CO., Cincinnati, Ohio.—Three models of similar chassis; high wheel type, motor double opposed, water-cooled, crosswise under body, 4x4, 12 H. P.; Model H, open cushion tired runabout, $640; with top, $680; Model P runabout, with pneumatic tires, $740. Described in our April, 1907, issue, page 136.

ST. LOUIS CAR CO., St. Louis, Mo.—American Mors, 4-cylinder touring car, 3½x5, 14-18 H. P., $3500; American Mors, 4-cylinder touring car, 4 5-16 x 6, 24-32 H. P.; American Mors, 4-cylinder landaulet, 5x6, 40-50 H. P.

SIMPLEX MOTOR CAR CO., Mishawaka, Ind.—Simplex American, Model D, 4-cylinder, 2-cycle touring car, 5x5, 50 H. P., $4000.

SMITH AUTOMOBILE CO., Topeka, Kan.—Two models on practically similar chasses. The Great Smith Touring Car, motor, 4-cylinder, 4½x5; French rating, 24 H. P., will develop, it is claimed 45 H. P., $2600. 1908 models described in this issue, page 77.

WAYNE AUTOMOBILE CO., Detroit, Mich.—Two models, 4 cylinders, 4½x5¼, 30-35 H. P., Wayne "Thirty," $2500, with touring or runabout body. Described in this issue, page 148.

WELCH MOTOR CAR CO., Pontiac, Mich.—Welch models all have the same motor, 4 cylinders, and one model H, 6 cylinders, all 4⅝x5. The 6-cylinder car is 75 H. P., $6000; Model I, 4-cylinder, 50 H. P., $5500; Model G, 4-cylinder, 50 H. P., $4000.

YORK MOTOR CAR CO., York, Pa.—Models I, 4-40, and J each 40 H. P., having the same 4-cylinder engine, 4 15-16 x 5¼; Model 4-40 seats 3, $3000; Model I seats 5, $3250; Model J seats 7, $3750; Model 6-30, 6 cylinders, 3¾x3¾, 30 H. P., seats 3, $2750; Model H, 4 cylinders, 3¾x3¾, 20 H. P., touring car, $1875. 1908 models described in the October, 1907, issue, page 126.

Cars at Madison Square Garden

AUTOCAR COMPANY, Ardmore, Pa.—Autocar 5-passenger touring car, 4 cylinders, 4½x5½, 30 H. P., $2750; Autocar runabout, seats 3, 4 cylinders, 4¼x4½, 30 H. P., $2750; Autocar runabout, seats 3, 2 cylinders opposed, under the hood at the front, 4x4, 12 H. P., $1200. Described in this issue, page 156.

CADILLAC MOTOR CAR CO., Detroit, Mich.—Cadillac, seats 2, 10 H. P., 5x5, $850; Cadillac touring car, 10 H. P., 5x5, $1000; Cadillac 5-passenger touring car, 4 cylinders, 4x4½, 25 H. P., $2000; Cadillac runabout, seats 3, 4 cylinders, 4x4½, 25 H. P., $2000; Cadillac runabout, seats 4, 1 cylinder horizontal, 5x5, 10 H. P., $1000; Cadillac 5-passenger, 4 cylinders, 4x4½, 25 H. P., $3000. Described April, 1907, page 112.

ELECTRIC VEHICLE CO., Hartford, Conn.—Columbia 5-passenger touring car, 4 cylinders, 4¼x4½, 28 H. P., $3000; Columbia 7-passenger touring car, electric transmission, 4 cylinders, 5½x5½, 48 H. P., $6500; Columbia runabout, seats 3, 4 cylinders, 4¼x4½, 28 H. P., $3000; Columbia landaulett, seats 5, 4 cylinders, 4¼x4½, 28 H. P., 4200; Columbia limousine, seats 7, electric transmission, 4 cylinders, 5½x5½, 48 H. P., $8500. Described in the March, 1907, issue, page 125.

CORBIN MOTOR VEHICLE CO., New Britain, Conn.—Five-passenger touring car, 4 cylinders, air-cooled, 4½x4¼, $2650; 5-passenger touring car, 4 cylinders, water-cooled, 4½x4¼, 32-40 H. P., $2500; runabout, seats 4, 4 cylinders, air-cooled, 4½x4¼, 32 H. P., $2650; Corbin landaulett or limousine, seats 5, air or water cooled, 4½x4¼, 32 H. P., $3500. Described in the March, 1907, issue, page 276.

ELMORE MFG. CO., Clyde, Ohio.—Elmore 5-passenger touring car, 2-cycle engine, 4½x4, 4 cylinders, $2500; Elmore 5-passenger touring car, 4 cylinders, 2-cycle, 4½x4, $2500. Described in our February, 1907, issue, page 253.

H. H. FRANKLIN MFG. CO., Syracuse, N. Y.—Four-passenger touring car, 3¼x3¼, 4 cylinders, air-cooled, $1850; 5-passenger touring car, 4 cylinders, air-cooled, 4¼x4, 28 H. P., $2850; also 5-passenger touring car, same chassis, $2850; 4-passenger touring car, 6 cylinders, air-cooled, 4½x4, 42 H. P., $4000; 7-passenger touring, 6-cylinders, 4¼x4, air-cooled, 42 H. P., $4000; runabout, seats 2, 4 cylinders, air-cooled, 3½x3¼, 16 H. P., $1750; runabout, seats 4, 6 cylinders, air-cooled, 4½x4, 42 H. P., $4000; runabout, seats, 4, 4 cylinders, air-cooled, 3¼x3¼, 16 H. P., $1850; runabout, seats 4, 4 cylinders, air-cooled, 4¼x4, 28 H. P., $2850; Franklin, seats 5, 4 cylinders, air-cooled, 4¼x4, 28 H. P., $4000; Franklin, seats 7, 6 cylinders, air-cooled, 4¼x4, 42 H. P., $5200; Franklin, seats 7, 6 cylinders, air-cooled, 4¼x4, 42 H. P., $4000. Described in the October, 1907, issue, page 168.

HAYNES AUTOMOBILE CO., Kokomo, Ind.—Five-passenger touring car, 4 cylinders, 4¼x5, 30 H. P., $2500; 5-passenger touring car, 4 cylinders, 4¾x5, 45 H. P., $3000; Haynes 7-passenger touring car, 4 cylinders, 5½x6, 60 H. P., $3750. Described in the March, 1907, issue, page 215.

KNOX AUTOMOBILE CO., Springfield, Mass.—Five-passenger touring car, 4 cylinders, 4¾x4¾, air-cooled, $2600; Knox runabout, seats 3, 4⅜x4¾, air-cooled, 25-30 H. P., $2500; Knox 5-passenger car, 4 cylinders, air-cooled, 4⅜x4¾, 30 H. P., $3500. Described in the November, 1906, issue, page 114.

MATHESON MOTOR CAR CO., Wilkes-Barre, Pa.—Matheson runabout, seats 4, 4 cylinders, 5x6, 40 H. P., $5500; Matheson, seats 7, 4 cylinders, 5x6, 40 H. P., $6500; 7-passenger touring car, 4 cylinders, 5x6, 40 H. P., $5500. Described in the February, 1907, issue, page 181.

NORTHERN MOTOR CAR CO., Detroit, Mich.—Five-passenger touring car, double opposed, 5½x5¼, 24 H. P., $1600; 7-passenger touring car, 4 cylinders, 5x5½, 40 H. P., $3500; runabout, seats 3, 2 cylinders, opposed, 5½x5¼, 24 H. P., $1600; limousine, seats 7, 2-cylinder, opposed, 5½x5¼, 24 H. P., $2800. To be described.

OLDS MOTOR WORKS, Lansing, Mich.—Five-passenger touring car, 4½x4¾, 4 cylinders, 32 H. P., $1900; 5-passenger touring car, 4 cylinders, 4¾x4¾, 36 H. P., $2750; 7-passenger touring car, 6 cylinders, 4½x4¾, 48 H. P., $4200; runabout, seats 3, 4 cylinders, 4¾x4¾, 36 H. P., $2750; 7-passenger car, 6 cylinders, 4½x4¾, 48 H. P., $4200. Described in this issue, page 90.

PACKARD MOTOR CAR CO., Detroit, Mich.—Seven-passenger touring car, 4 cylinders, 5x5½, 30 H. P., $4200; 7-passenger, 4 cylinder car, 5x5½, 30 H. P., $5600 Packard runabout, seats 2, 4 cylinders, 5x5½, 30 H. P., $4200. Described in the July, 1907, issue, page 64.

PEERLESS MOTOR CAR CO., Cleveland, O.—Seven-passenger touring car, 4 cylinders, 4⅞ 30 H. P., $4500; 7-passenger, 6 cylinder touring car, 4⅞x5½, 57 H. P., $6000; runabout, seats 3, 4 cylinders, 4⅞x5½, 30 H. P., $4300; Peerless, seats 7, 4 cylinders, 4⅞x5½, 30 H. P., $5500; Peerless, 6-cylinder, 7-passenger, 4⅞x5½, 57 H. P., $6000. Described in December, 1906, issue, page 139.

GEORGE N. PIERCE CO., Buffalo, N. Y.—7-passenger touring car, 5x5½, 40 H. P., $5000; 6 cylinders, 7-passenger touring car, 4¼x4⅞, 43 H. P., $5500; 7-passenger, 6-cylinder touring car,

Hosted by Google

5x5¼, 60 H. P., $6500; 6-cylinder, 7-passenger car, 4¼x4⅞, 43 H. P., $5500; 6-cylinder, 7-passenger car, 5x5½, 60 H. P., $6500.

POPE MFG. CO., Hartford, Conn.—Pope-Hartford "303," 5-passenger touring car, 30 H. P., $2750. Described in our May, 1907, issue, page 62.

ROYAL MOTOR CAR CO., Cleveland, Ohio.—Royal tourist, 7-passenger touring car, 4 cylinders, 5⅛x5½, 45 H. P., $4000; Royal 7-passenger, 4-cylinder car, 5⅛x5½, 45 H. P., $5000. Described in our February, 1907, issue, page 228.

SELDON MOTOR VEHICLE CO., Rochester, N. Y.—5-passenger touring car, 4 cylinders, 4¼x4½, 28 H. P., $2000; 7-passenger touring car, 4 cylinders, 5¼x6, 45 H. P., $5500.

STEARNS CO., F. B., Cleveland, Ohio.—7-passenger touring car, 4 cylinders, 5⅜x5⅞, 46.22 H. P., $4600; 6-cylinder, 4-passenger car, 5⅜x5⅞, 69.3 H. P., $6250; runabout, seating 4, same chassis, $6250. Described in our December, 1906, issue, page 149.

STUDEBAKER AUTO CO., South Bend, Ind.—5-passenger touring car, 4 cylinders, 4⅛x5¼, 27.2 H. P., $3500; 7-passenger touring car, 4 cylinders, 4¾x5½, 36.1 H. P., $4000; runabout, seats 3, 4 cylinders, 4⅛x5¼, 27.2 H. P., $3500; 4-cylinder, 7-passenger car, 4⅛x5¼, 27.2 H. P., $4200. Described February, 1907, page 158.

STEVENS-DURYEA CO., Chicopee Falls, Mass.—5-passenger touring car, 4 cylinders, 3⅞x4¾, 35 H. P., $3500; 7-passenger touring car, 4¾x5¼, 50 H. P., $6000; 4-cylinder, 7-passenger car, 3⅞x4¾, 35 H. P., $4500; 4-cylinder, 5-passenger car, 3⅞x4½, 20 H. P., $3300; 6-cylinder, 7-passenger limousine, 50 H. P., $6000; 5-passenger car, 3⅞x4¾, 35 H. P., $3500; 6-cylinder, 7-passenger landaulett, 3⅞x4¾, 35 H. P., $4500. Described March, 1906, page 202.

E. R. THOMAS AUTOMOBILE CO., Buffalo, N. Y.—Thomas 4-60 Flyer, 7-passenger touring car, 4 cylinders, 5½x5½, 48.4 H. P., $4500; Thomas 6-70 Special, 7-passenger, 6-cylinder touring car, 5½x5½, 72.6 H. P., $6000; Thomas 4-cylinder, 6-passenger car, 3¾ x 4 5-16, 16.9 H. P., $3000; 6-cylinder, 7-passenger car, 5½x5½, 72.6 H. P., $6000. 1908 cars described October, 1907, page 101.

E. R. THOMAS DETROIT CO., Detroit, Mich.—Thomas 4-40 Detroit 5-passenger touring car, 4 cylinders, 5x4¾, 40 H. P., $2750. Described, October, 1907, page 86.

WALTER AUTOMOBILE CO., Trenton, N. J.—7-passenger touring car, 4 cylinders, 5x5½, 44 H. P., $5000. Described February, 1907, page 217.

WINTON MOTOR CARRIAGE CO., Cleveland, Ohio.—Six-Teen-Six 7-passenger, 6-cylinder touring car, 4½x5, 48.6 H. P., $4500; Six-Teen-Six, 6-cylinder, 7-passenger, 4½x5, 48.6 H. P., $4500. Described in our September, 1907, page 132.

Engines

AMERICAN AND BRITISH MFG. CO., Providence, R. I. (at both shows)—prest steel frames, drop forgings such as described in our January, 1907, issue, page 210; also the "Herreshoff" gasoline motor described May, 1907, page 332, including a new size rated at 40 H. P., but said to develop 55 H. P.

AURORA AUTOMATIC MACHINERY CO., Aurora, Ill. (at both shows), are showing an entirely new 6-cylinder Thor engine; cylinders, 4¾x4¾, developing 55 to 60 H. P. at 1500 revolutions. The engine is very compact and weighs only 728 pounds. It has a special crank case which is made to inclose the magneto, circulating pump and the carburetor, as well as all the parts of the engine. There are quite a number of new features in this engine which will be described in detail in our next number. They are also showing an entirely new Thor motor cycle engine, the main feature of which is an internal transmission gear running on ball and roller bearings inclosed in the crank case.

BRENNAN MOTOR CO., 103 Grape street, Syracuse, N. Y. (at Madison Square Garden)—Brennan "Special" 16 and 20 horse power, opposed motors; three four-cylinder, vertical motors; one six-cylinder motor.

BROWNELL, F. A. MOTOR CO., successors to BROWNELL-TREBERT CO., 634-666 Lexington avenue, Rochester, N. Y. (at Grand Central Palace)—30 H. P. 4-cylinder, 35, 40, 45 and 75 H. P. 6-cylinder motors, all new B-T 1908 models; a new circulation pump and a new carburetor for 6-cylinder motors, practically three carburetors in one, all to be described in our next issue.

THE MANUFACTURERS' FOUNDRY CO., Waterbury, Conn. (at Madison Square Garden)—samples of their gasoline engine cylinder castings, as described in our October, 1907, issue, page 114, and our January, 1906, number, page 1?5, including samples of castings furnished for 1908 engines.

PACIFIC IRON WORKS, THE, Bridgeport, Conn. (at Grand Central Palace), exhibited a 4-cylinder air-cooled automobile motor.

Ignition Apparatus

AMERICAN MOTOR CO., Box 94, Grand Rapids, Mich. (at Madison Square Garden)—the Petite cut-out for disconnecting the ignition current, described in our June, 1907, issue, page 222.

AMERICAN ELECTRICAL NOVELTY & MFG. CO., Spring, Hudson and Vandum streets, New York City (at both shows), exhibit the well known Ever-Ready batteries, Ever-Ready Bulldog battery connectors, portable electric hand lamps, pocket lamps, flashlights, ammeters and volt ammeters.

ATWATER-KENT MFG. CO., 42-46 North Sixth street, Philadelphia, Pa. (at both shows)—the Atwater-Kent Spark Generator, described in our February, 1906, issue, page 321, and the new distributor system to be fully described in a future issue; also a full line of pocket meters which are well known to the trade. An interesting feature of the exhibit is one of their instruments sealed up in a glass case, running on six dry cells, with a Jones odometer and speedometer attached, to show the mileage which can be secured by the use of the Atwater-Kent generator atached to a 4-cylinder engine. This will be run thruout the week.

THE AUTOCOIL CO., 136 Seventh street, Jersey City, N. J. (at both shows), are showing the line of coils which they have been making for some time past, with hard rubber units, including their ammeter coil, all of which have been previously described, and are also showing a new 6-cylinder coil with iron clad units, which is very compact, the 6-cylinder coil being about the same size as the old 4-cylinder coil; this has no terminals whatever outside of the case; has an invisible friction device on set screw, and a spark gap to prevent straining of the coil because of any broken connection, and also a new switch. The coil will be illustrated next month.

AMPERE MFG. CO., 408 West Thirteenth street, New York City (at Grand Central Palace), exhibted the "Best" dry batteries, made in five different sizes, described in the September, 1907, issue, page 162.

BRETZ CO., J. S., Times Building, New York City (at Grand Central Palace) exhibited the Fichtel and Sachs annular ball bearings, which were described in our February, 1907, issue, page 308; and the Umterberg and Helmle high tension magneto, which they have just started to import.

BOSCH, ROBERT, 160 West Fifty-sixth street, New York City (at Madison Square Garden)—"Bosch" high tension magnetos, the exhibit including the "D 6" for 6-cylinder cars, "D 4" for 4-cylinder cars, "H D H" giving four sparks per revolution, "D A V" for 2-cylinder cycle motors, "D A 2" for single cylinder cycle motors, "D O 2" for opposed cylinder engines, "D 2 R" for marine single cylinder motors, "22" high tension magneto, "13" low tension type for large engines, "K S 2" with rotating armature. The Bosch system was described in our December, 1906, issue, page 240, and 1908 improvements will be described in our next issue.

BYRNE, KINGSTON & CO., Kokomo, Ind. (at both shows), are exhibiting their well known line of Kingston carburetors, pumps and muffler, and in each line they are showing a new design. Their new circulating pump and muffler are especially noteworthy.

ALBERT CHAMPION CO., 541 Tremont street, Boston, Mass. (at Madison Square Garden)—1908 "Champion" ignition apparatus.

CONNECTICUT TELEPHONE & ELECTRIC CO., 50 Britania street, Meridon, Conn.)at both shows)—"Connecticut" spark coils with 1908 improvements; a new distributor, new magneto switch, a new inspection lamp, and a new marine coil to be described in our next issue. Besides these new things the exhibit includes the "Connecticut" plug and lever switches, described in our March, 1906, Journal, page 272, and the "Connecticut" gasoline gage, described in our February, 1907, issue, page 310.

CROWN BATTERY CO., THE, 992 Southern Boulevard, New York City (at Grand Central Palace), exhibited the Crown dry cells, described in the July, 1907, issue, page 130.

Hosted by Google

DAYTON ELECTRICAL MFG. CO., 89 St. Clair street, Dayton, O. (at both shows), the well known "Apple" ignition system, new features of which were described in our January, 1907, issue, page 352; May, 1907, issue, page 158, and October, 1907, issue, page 172. The outfit was shown in working order, the dynamo, driven off a flywheel as in actual practice, charging the storage battery from which the current was taken, and was distributed to the coils, and hence to a set of plugs, the switches, coils, etc., being mounted on a board representing the dash of a car.

THE DELTA MFG. CO., Bloomfield, N. J. (at Madison Square Garden)—"Delta" No. 8 dry cell for ignition purposes, and the "Delta" spark plug, described January, 1907, page 258, the plug being shown in new form of shipping box, described in this issue.

DOW PORTABLE ELECTRIC CO., Braintree, Mass. (at Grand Central Palace), exhibited a new Komet magneto, which is extremely small and light, and is made in small sizes for motor cycle work; also a new distributor intended especially for double ignition systems. These new devices will be illustrated fully in our next issue. The Dow Company will show their regular line of coils, plugs and switches, which have been illustrated in our past issues. The Komet magneto was described July, 1907, page 128.

EASTERN CARBON WORKS, West Side avenue and Central R. R., Jersey City, N. J. (at both shows)—are showing the Eastern dry cells in a variety of sizes, making a specialty of motor cycle size, in a special case; also the Eastern Battery Connector and the Eastern Volt Ammeter, described April, 1907, page 242.

ELECTRIC STORAGE BATTERY CO., Nineteenth and Allegheny avenue, Philadelphia, Pa. (at both shows)—"Exide" storage batteries, both vehicle and ignition types, both of which have been fully described in these columns. Different types of plates, straps and separators are exhibited on a large wooden panel.

GLEANZER & CO., 26-28 Washington Place, New York City (at Grand Central Palace)—"Nieuport" 1908 magnetos, to be described in our next issue.

GEIZLER BROS., 316 West Forty-second street, New York City (at Grand Central Palace), exhibit the Geiszler storage battery for electric automobiles, and also the Geiszler non-sulphating ignitor, the complete details of which will be given in our next issue.

GOULD STORAGE BATTERY CO., 341 Fifth avenue, New York City (at Madison Square Garden)—"Gould" 1908 vehicle storage batteries, described in this issue, page 209, and the 1908 "Gould" sparking battery, also described in this issue

THE R. E. HARDY CO., 86 Watts street, New York City, N. Y. (at Madison Square Garden)—"Sta-Rite" spark plugs, coils, etc., which have been described in past issues of the Journal, and including the No. 4 Sta-Rite separable plug, described in our December, 1906, issue, page 106, and the two new plugs, described in our October, 1907, issue, page 178; also some plugs of special size for large engines requiring extra long plugs.

HEINZE ELECTRIC CO., Lowell, Mass. (at both shows)—complete line of induction coils, as described in our February, 1907, issue, pages 350 and 434; and a new high tension magneto, to be described next month, and the Heinze timer, described in our February issue, page 296. The exhibit also includes a testing outfit, which is described and illustrated in this issue, page 252.

HERZ & CO., 203-205 Lafayette street, New York City (at both shows)—"Herz" timers and distributors; "Bougie-Mercedes" spark plugs; "B. B." circulation pump; "Herz" tires; "Pater Noster" shock absorbers, and various Herz ignition specialties, descriptions of which have appeared in the following issues of the Journal: January, 1907, pages 254 and 302; February, 1907, pages 362 and 372, and October, 1907, page 196.

JANNEY, STEINMETZ & CO., Fourth and Market streets, Philadelphia, Pa. (at Madison Square Garden)—the Bi-magnet liquid indicator, described in our September, 1906, issue, page 122; Richards aluminum solder, described in our November, 1906, issue, page 162; Flashlight spark plugs, described in our April, 1907, issue, page 238; also a full line of tanks and other prest metal specialties well known to the trade.

JEFFERY-DEWITT CO., 217-219 High street, Newark, N. J. (at both shows)—The "Reliance" spark plug, described in the October, 1907, Journal, page 196; demonstrations given of the ability of the plug to spark in water; also soot and carbon tests of the plug. The demonstrating outfit comprised a representation of a 4-cylinder ignition system, but the plugs were submerged in tumblers of water instead of being in the open, fully proving the good sparking qualities of the plug.

K-W IGNITION CO., 30 Power avenue, Cleveland, Ohio (at Grand Central Palace), exhibited the K-W magneto, described in our May, 1907, issue, page 172; the K-W Master Vibrator, in our October, 1907, issue, page 194, and the Vim Spark Plug, described in our April, 1907, issue, page 194.

THE KOKOMO ELECTRIC CO., Kokomo, Ind. (at Grand Central Palace), are exhibiting the Kingston timers, coils, plugs and switches, which are well known to our readers as having formerly been the product of Byrne, Kingston & Co. They are also showing a new two-pole switch and a new vibrator on their 1908 coil, which will be described next month.

THE KITSEE STORAGE BATTERY CO., E. L. Bevan, General Sales Agent, 628-629 Connell Building, Scranton, Pa. (at Madison Square Garden)—Kitsee sparking battery, described in our May, 1907, issue, page 164.

LAVALETTE & CO., 112 West Forty-second street, New York (at Grand Central Palace), exhibted the Eisemann-Lavalette high tension magneto, illustrated and described in our March issue, page 316; also a line of automobile parts manufactured by Mallicet & Blin, of France. Also the Schmidt patent silent drive chain.

MOSLER, A. R. CO., 163 West Twenty-ninth street, New York City (at both shows)—full line 1908 "Mosler" and "Spitfire" ignition apparatus, including an improved form of the Mosler roller contact timer now fited with ball bearings; the "Spitfire" protector plug described in our January, 1907, issue, page 280; the Mosler eccentric timer described in our February, 1907, issue, page 277; also new control levers and new mica spark plugs, to be described in our next issue.

MOTSINGER REVICE MFG. CO., Pendleton, Ind. (at Madison Square Garden)—the well known Antosparker and the Motsinger Muffler, described in our March, 1906, issue, page 290.

NATIONAL BATTERY CO., 368 to 383 Massachusetts avenue, Buffalo, N. Y. (at both shows)—"National" 1908 ignition and propulsion batteries, described in our next issue, the exhibit including a 6-volt, 60 ampere hour, and a 6-volt, 40 ampere hour sparking battery; also a vehicle battery and a display of battery parts and accessories.

NATIONAL CARBON CO., Cleveland, Ohio (at both shows), are exhibiting the well known Columbia and Ignitor dry batteries. Also tubular auto cells, National jump spark coils, Columbia battery connectors, flashlights and ampere meters.

NEW YORK COIL CO., 338 Pearl street, New York City (at Grand Central Palace), exhibited a new double pole switch equipt with the Yale lock, which can be used with two sets of batteries or batteries and magneto. They also exhibted their well-known line of spark coils and their hammer brake vibrator. Described March, 1907, page 344b.

PITTSFIELD SPARK COIL CO., Dalton, Mass. (at Madison Square Garden)—Pittsfield coils, magnetos and spark plugs. Their latest devices were described February, 1907, page 336, and January, 1907, page 322a.

REMY ELECTRIC CO., Columbus avenue and Twenty-sixth street, Anderson, Ind. (at both shows)—Remy Type H. B. high tension magneto, described January, 1907, page 206; Remy Type R. B. low tension magneto, described march, 1907, page 318; the new Remy Type F high tension magneto, described page 264, this issue.

SEMI-DRY BATTERY CO., Fifth and Essex streets, Harrison (Newark), N. J. (at Grand Central Palace)—the "Dunn" semi-dry cells for ignition purposes, described in our November, 1905, issue, page 162, the line including a new emergency battery, described in our next issue, and a waterproof "Dunn" battery for marine use, described in our June, 1907, issue, page 246.

SPLITDORF, C. F., 261-265 Walton avenue, New York City (at both shows)—the "Splitdorf" line of ignition apparatus, including the new high tension magneto for motor cycles, described in the December, 1906, issue, page 330; the self-cleaning mica plug, described page 274, January, 1907, issue; motor cycle coils, described March, 1907, page 353; new motor cycle spark plug, described September, 1907, page 208; and the new "Splitdorf" motor car coil, described in our next issue.

Hosted by Google

STACKPOLE BATTERY CO., St. Marys, Pa. (at Madison Square Garden)—"Stackpole" dry cells for ignition purposes, the "Mills" battery connector, and "Stackpole" battery testing instruments, all of which will be described in a future issue.

TRIUMPH ENGINEERING CO., THE, 226 Lafayette street, New York City (at Grand Central Palace), exhibited the Holsten vibrating spark plug, which has been described in our January, 1907, issue, page 232.

UNCAS SPECIALTY CO., 21-37 Shipping street, Norwich, Conn. (at Madison Square Garden)—Leavitt timer, described February, 1907, page 352; Leavitt timer, described March, 1907, page 284, and other Leavitt specialties.

VESTA ACCUMULATOR CO., 1336 Michigan avenue, Chicago, Ill. (at Madison Square Garden), will show the well known Vesta sparking battery and a full line Vesta electric lamps, described in previous issues.
ment of their business.

WESTERN ELECTRIC CO., THE, Chicago, Ill., exhibit the W. E. Synchronized Ignition System, which is somewhat of a departure in the fact that the coils are arranged in a long hard rubber tube close to the top of the cylinders, so that very short connections only are necessary between them and the spark plugs, and also to the timer. In connection with this a vibrator box containing two vibrators is located on the dash; these can be set independently and used alternatively. An ingenious switch is also located in this box. Full details and particulars of this system will be given in our next issue. They also exhibited a jump-spark coil of their own manufacture, and the well known Nungesser dry batteries.

WITHERBEE IGNITER CO., 541 West Forty-third street, New York City (at both shows)—"Witherbee" ignition battery, described February, 1907, page 350, and the new "Wico" spark plug, described in this issue, page 405; also several new ignition specialties to be described, among which are a wire protected inspection lamp and the Wico timer. A feature of this exhibit is a large Witherbee battery turned into a beehive, containing about 3000 bees.

Lamps, Etc.

ACETYVONE CO., 38 Park Row, New York City (at both shows)—"Acetyvone" generator for producing acetylene gas from cartridges of Acetyvone, described in our March, 1907, number, page 304, and not changed in construction since.

AUTOLIGHT MFG. CO., THE, A. H. Funke, Propr., New York City (at Grand Central Palace), exhibited the well known autolight gas lamps and generators, and a new speed indicator, which will be described in a future issue.

AUTOMOBILE SUPPLY MFG. CO., 139 Emerson Place, Brooklyn, N. Y. (at both shows)—full line of horns and lamps, as described in our January, 1906, issue, page 376; December, 1906, issue, page 284, and September, 1907, issue, page 168; also a number of new styles to be described.

BADGER BRASS MFG. CO., Kenosha, Wis. (at both shows)—1908 models of the well known "Solar" lamps and a new line made under the Bernard patents, under which Badger Brass Mfg. Co. are sole American licensees, all to be fully described in our next issue.

BROOKE AUTOMOBILE SUPPLY CO., 197 Fulton street, New York (at Grand Central Palace) exhibited the Brooke searchlight, Basco luggage carrier for automobile use, and the Basco generator; also a new wind shield.

R. E. DIETZ CO., 35 Laight street, New York City (at Madison Square Garden)—1908 Dietz line of lamps, including two models, to be described in our next issue; also those described in our January, 1907, issue, page 308.

EDMONDS & JONES MFG. CO., 313-315 Riopelle street, Detroit, Mich. (at both shows), are showing their complete line of gas lamps and generators; also an entirely new line of oil lamps, including three sizes of side lamps in both the square and round patterns, and two sizes of tail lamps in both the square and round patterns. They are also showing a new round generator complete, on the same principle as their old generator, described in January, 1907, with several new features, which we will describe next month.

ENGLISH & MERSICK LAMP & FOUNDRY CO., 129-131 Park street, New Haven, Conn. (at Madison Square Garden)—"E & M" lamps and automobile metal fittings, new features will be described in our next issue.

GRAY & DAVIS, Amesbury, Mass. (at both shows)—Gray & Davis 1908 lamps, the line including the fine new straight line searchlight, which is described and illustrated in this issue, page 256; also the recently designed Style 48 searchlight, described in the June, 1907, Journal, page 196, and the new generators, described in our February, 1907, issue, page 268.

HAM, C. T., MFG. CO., Rochester, N. Y. (at both shows)—"Ham" cold blast lamps, which show no changes from last year's designs. These lamps and their special lamp bracket were described in our December, 1906, issue, page 290, and our February, 1907, issue, page 360.

MANHATTAN SCREW & STAMPING WORKS, 67th street and West End avenue, New York City (at both shows), exhibit a line of Phoebus gas and oil lamps, described in our February and April issues. Two new additions to their line are an Alpha type gas lamp and a light magnifier, which is fitted with a magnifying lens. They also show a new low-priced tail oil lamp. The fronts of their oil lamps are now fitted with a new spring catch, which makes them very easily detachable.

NATIONAL SALES CORPORATION, THE, 296 Broadway, New York City (at Grand Central Palace),exhibited the new Multiplex electric lamp, made by the Royal Battery Co. This is furnished in all the usual styles of gas lamps, and is equipt with a very small electric bulb which is wired up so as to give various strengths of light from 16 to 150 candle power; also an electric tail lamp with an electric device which announces when the lamp goes out from any cause whatever by their whistle or bell. This device is described in this issue, page 202. They also exhibited the Pirelli tires, the Conover wind shields, described March, 1907, page 342, and the Geecee batteries, described September, 1906, page 146.

PIERSON MOTOR SUPPLY CO., 1175 Bedford avenue, Brooklyn, N. Y. (at both shows)—full line of lamps, as described in our July, 1907, issue, page 158; also "Puritan" gas tanks, Weiss siren horns, S. C. tire inflators, the Weiss-Underhill speed indicator, and the Racine Folding Chair, descriptions of which will appear in future issues of the Journal.

ROSE MFG. C0., 910 Arch street, Philadelphia, Pa. (at both shows)—"Neverout" double focus searchlight, described March, 1907, page 282; new "Neverout" lamps, described January, 1907, page 314, as well as other new patterns to be described in our next issue, and the 1908 "Neverout" gas producer, in both single and double chamber patterns, fully described and illustrated in this issue, page 226.

RUSHMORE DYNAMO WORKS, 629 South avenue, Plainfield, N. J. (at Madison Square Garden)—"Rushmore" headlights, described in our February, 1907, issue, page 346; 1908 Rushmore generator and headlight for high-powered runabouts, all these products showing no material change; detail improvements are described in this issue, page 203.

SAXON LAMP WORKS, THE, 526 West Twenty-eighth street, New York City (at Grand Central Palace), exhibited in addition to their line of lamps a novelty in the shape of a clock encased in a lamp frame and covered by a glass case. These are made in two sizes, at $10 and $75, respectively. They also exhibited Saxon enunciators, which will be described in future issues.

Jacks

COMPTOIR DE INNOVATIONS, 1693 Broadway, New York City (at Grand Central Palace), exhibited the Delpeuch mechanical tire inflater, the Delpeuch Jack, nightingale whistle; all imported from France.

COOK'S STANDARD TOOL CO., Kalamazoo, Mich. (at Madison Square Garden)—"Cook's" 1908 "Standard" Jack, described in this issue, page 260, and the Cook Standard Tool grinder, described page 358, January, 1906.

DUFF MFG. CO., Westinghouse Building, Pittsburg, Pa. (at Madison Square Garden)—the 1908 model of the "Barrett," described in next issue.

ELITE MFG. CO., Ashland, Ohio (at Grand Central Palace), are exhibiting the Reliable compound tire pump and the Reliable automobile jack, which will be illustrated and described in our next issue.

OLIVER MFG. CO., 203 South Desplaines street, Chicago, Ill. (at both shows), are exhibiting their well known Peerless E-Z and Sampson Jacks, which have been described in detail in various issues in the past.

Hosted by Google

Motorcycles

ARMAC MOTOR CO., 472 Carroll avenue, Chicago, Ill. (at Madison Square Garden)—"Armac" 1908 motorcycles.

CONSOLIDATED MFG. CO., Toledo, Ohio (at Madison Square Garden)—1908 "Yale-California" motor cycle, to be described in our next issue.

G. H. CURTISS MFG. CO., Hammondsport, N. Y. (at Madison Square Garden)—1908 "Curtiss" motor cycles and motors.

EXCELSIOR SUPPLY CO., 233-237 Randolph street, Chicago, Ill| (at Madison Square Garden) —X L C R ignition battery, described in our October, 1907, issue, page 160, and the "Triumph" motor cycle, described in our September, 1907, issue, page 206.

HENDEE MFG. CO., 837 State street, Springfield, Mass. (at Madison Square Garden)—the 1908 "Indian" line of motor cycles, including a new 2¾ H. P., single cylinder machine, a new 3½ H. P., single cylinder machine, and a new 5 H. P., 2-cylinder machine; also a new attachment that will change the inlet valves of any of their machines to mechanical operation; also new batteries and magnetos offered in conjunction with the 1908 machines; all to be described in our next issue.

MERKEL MOTOR CO., 1098 Twenty-sixth avenue, Milwaukee, Wis. (at Madison Square Garden)—"Merkel" 1908 motor cycles, to be described in the December Journal.

OVINGTON MOTOR CO., 2208 Broadway, New York (at both shows), are showing the F. N., 4-cylinder motor cycle, as described page 206, August, 1906. They also show this machine with a fore-carriage and a single cylinder machine of the same make. These machines are equipped with Simms Bosch Magneto Ignition; they also show an extensive line of motor cycle accessories.

READING STANDARD CO., Reading, Pa. (at both shows))—R-S motor cycles, tandems, tricars, etc., the 1908 line possessing several distinct improvements over the 1907 model, described in our January, 1907, issue, page 356a. 1908 details will be published in the next issue.

RELIANCE MOTOR CYCLE CO., Addison, N. Y. (at Madison Square Garden)—Reliance motor cycles.

THOMAS AUTI-BI CO., 1443 Niagara street, Buffalo, N. Y. (at Madison Square Garden)—the Auto-Bi motor cycle.

Oils, Polishes, Etc.

ALLERS & CO., H. A., 136 Liberty street, New York City (at Madison Square Garden)—"Solarine" metal polish, described February, 1904, page 160h, and Black Solarine, described page 366, February, 1907, issue.

AMERICAN ALUMINUM COATING CO., 1004 Diamond Bank, Pittsburg, Pa. (at Madison Square Garden)—aluminum coated steel plates, described in our May, 1907, issue, page 142.

COOK'S SONS, ADAM, 313 West street, New York City (at Madison Square Garden)—"Albany" grease, the well known lubricant, and "Perfect" grease cups, which are recommended for automobile use with "Albany" grease, described in our March, 1906, issue, page 294.

DIXON, JOSEPH, CRUCIBLE CO., Jersey City, N. J. (at both shows)—"Dixon" graphite products, including motor graphite, cup greases, chain compound, pipe joint compound, special transmission grease; also crucibles, all of which have been fully described in past issues of the Journal. A feature of the exhibit is a sliding gear transmission running in their special graphite grease.

HARRIS, A. W., OIL CO., 326 South Water street, Providence, R. I. (at both shows), exhibit the well known Harris oils and greases. They have a new wrinkle to show the qualities of their various grades of oils by brass tubes, which rotate, and the weight of each quality of oil is shown by the movement of the oil from the top to the bottom. They have added a new transmission lubricant to their line, which is more fluid than their regular transmission grease, and is light color. They are also furnishing their grease in 25 and 50 pound cans. Another new Harris specialty is the Harris liquid scouree for polishing all metal surfaces.

MILLER'S SONS, WM. P., 75--79 Third street, Long Island City, N. Y. (at Grand Central Palace)—a full line of Miller's lubricants, including the "Pale Light" oil for Packard car and a new fiberous oil, described in this issue, page 204.

NEW YORK AND NEW JERSEY LUBRICANT CO., 14-16 Church street, New York City (at both shows)—"Non-Fluid oils, a practical demonstration being given of a transmisison lubricated with these oils. Non-Fluid oils were described in our November, 1906, number, page 216.

RAIMES & CO., 50 Ferry street, New York City (at Grand Central Palace), exhibited the Globe liquid metal polish.

JOHN T. STANLEY, 642 West Thirtieth street, New York City, N. Y. (at Madison Square Garden)—Mobo auto body cleaner, Shofo hand cleaner, described January, 1907, page 228, and new body and metal polisher.

VACUUM OIL CO., Rochester, N. Y. (at Madison Square Garden)—"Vacuum Mobiloils" and greases in cans and barrels.

YOUNG, O. W., 174-180 Frelinghuysen avenue, Newark, N. J. (at Madison Square Garden)—Young's oils, greases and polishes; also Cox's tire repair outfits, plugs, cements, etc., described in past issues. The latest addition to the Young line is a non-fluid oil.

Shock Absorbers

ACME SPRING CHECK CO., THE, 1717 Broadway, New York (at Grand Central Palace), exhibited the Acme shock absorber, to be described.

AUTO-CHECK MFG. CO., 1876 Broadway, New York City (at Grand Central Palace), exhibited the Rountree-Stimmel auto check, which will be described in a future issue.

COMSTOCK SHOCK ABSORBER CO., 1775 Broadway, New York City (at both shows), exhibted the Comstock Shock Absorber, described in our August, 1907, issue, page 136.

CRESCENT PARTS CO., THE, 244 West Forty-ninth street, New York City (at Grand Central Palace), exhibited the Crescent removable rim, formerly the Harburg removable rim, which was described in our December, 1906, issue, page 96.

DIEZEMANN SHOCK ABSORBER CO., 420-424 East 106th street, New York City (at Grand Central Palace)—the 1908 Diezemann Shock Absorber, described and illustrated in this issue, page 182.

F. R. V. AUTO PARTS CO., 116 Nassau street, Room 705, New York City (at Grand Central Palace)—"F. R. V." transmissions, gearless differential, steering gears, shock absorbers, and other automobile parts. The shock absorber is described in this issue, page 222, and the gearless differential on page 258, while the other products will be described in future issues of the Journal.

HARTFORD SUSPENSION CO., 67 Vestry street, New York City (at both shows)—1908 Truffault-Hartford shock absorber, described in this issue, page 268; the device being demonstrated on two miniature motor cars running on a moving roadway; one car equipt with the Truffault-Hartford shock absorber, and the other without any such device.

HOTCHKIN MFG. CO., 1265 Michigan avenue, Chicago, Ill. (at both shows)—"Hotchkin" 1908 anti-jolt device, which is not changed materially from the 1907 model, described in the March, 1906, Journal, page 298, the slight changes being given in this issue.

PERFECTION SPRING CO., 2414 Superior avenue, Cleveland Ohio (at Grand Central Palace), exhibited the McIntyre Perfection spring, which has an auxiliary spring to absorb the shock. This spring was described in our October, 1906, issue, page 162.

SAGER CO., J. H., 265 South avenue, Rochester, N. Y. (at both shows)—the "Sager" equalizing springs, described in our February, 1906, issue, page 398; the "Sager" flexible springs, described in our December, 1906, issue, page 270, and a new tire grip.

STOLP SHOCK ABSORBER CO., No. 20 Fletcher street, New York, exhibited a shock absorber, consisting of a coil spring, holding a long lever which intervenes between the spring and axle. This device is not yet being manufactured for the market. As soon as it is ready for the market we will describe it fully.

SUPPLEMENTARY SPIRAL SPRING CO., 4524-4526 Delmar avenue, St. Louis, Mo. (at Grand Central Palace), exhibited their well known spiral spring shock absorbers in a variety of sizes, and also attached in several different ways. Decribed December, 1906, page 218.

VICTOR SHOCK ABSORBER CO., THE, 1937 Broadway, N. Y. (at Grand Central Palace), ex-

Hosted by Google

hibited Victor shock absorbers, which were illustrated in our April, 1907, issue, page 240.

Speed Indicators and Odometers

AUTO IMPROVEMENT CO., 304 Hudson street, New York City (at both shows), are exhibiting a large number of new novelties. Their speed indicator is now shown in three styles, the tourometer registering up to 50 miles, also showing a mileage for the trip and season. The roadster giving speed to 65 miles and mileage, trip and season. The Universal giving the same as the roadster, with an addition of a clock, all showing on the one dial. Their vulcanizer, a small one, and which was described last January, is now supplemented with two new sizes, one a shop size for inner tubes principally, and the other a large shop size for inner tubes and shoes. Another new addition to their line is the Ever-Ready spark plug. These new articles will be described in a future issue. They also exhibit the Ever-Ready starter, which has been described heretofore, and the Ever-Ready tire tube, described in February, 1907, page 312.

HICKS SPEED INDICATOR CO., 1263 Atlantic avenue, Brooklyn, N. Y. (at both shows), shows an improved speed indicator, combined with odometer and clock, illuminated by an electric light; in this issue, page 201; also the 1908 Jones speed-also an annunciator, to be described.

HOFFECKER CO., Park Square Motor Mart, Boston, Mass. (at Madison Square Garden)—the "Hoffecker" Speedometer, 1908 model, described in this issue, page 242.

INDEX SPEED INDICATOR CO., 719 Hennepin avenue, Minneapolis, Minn. (at both shows)—formerly the Oliver Instrument Co.—the 1908 "Index" speed indicator, described in our December, 1906, number, page 298, and not materially changed, only refined in detail.

JONES, JOSEPH W., Broadway and Seventy-sixth street, New York City, N. Y. (at both shows)—a new speed controling device, described in this issue, page 201; also the 1908 Jones speedometer, and a new $25 instrument, both to be described.

JONES, W. S., 112 North Broad street, Philadelphia (at both shows), exhibits the well known Lee speedistimeter, which has been described in our May, 1907, issue, page 162, and also in previous issues. He also exhibited for the first time the Phelps Vehicle Recorder, an entirely new instrument which records the movements of any vehicle to which it is applied, showing the number of stops, time the vehicle started, time occupied in trip, and the lapse of time between every stop and start. In other words, a complete record of its movements. This ingenious device was described October, 1907, page 158.

KILGORE MFG. CO., Old Town, Me. (at Madison Square Garden)—Kilgore 1908 shock eliminator, described in our August, 1907, issue, page 134.

LORING SPEED GAUGE CO., 91 Marshall street, Somerville, Mass. (at Madison Square Garden)—"Loring" 1908 speed gage, described in this issue, page 205, demonstrating devices being used to prove the accuracy of the instrument to spectators.

R. H. SMITH MFG. CO., Springfield, O. (at both shows)—the "Springfield Motormeter," a speed indicator, the 1908 model of which was described in our October, 1907, issue, page 176.

STEWART & CLARK MFG. CO., 502-520 Diversey Boulevard, Chicago, Ill. (at both shows)—"Stewart" 1908 speedometer, including a new type with odometer enclosed, and the new "American" speedometer, a moderate priced instrument, both of which are described in this issue, page 216. A feature of this exhibit is a cabinet on which several of the speedometers are placed with the shafts running down to a motor beneath, the motor operating the instruments each at a different speed.

VEEDER MFG. CO., Hartford, Conn. (at both shows)—"Veeder" speed and distance indicating instruments, including the well known "Veeder" odometer and the 1908 "Veeder" tachodometer, to be described.

WARNER INSTRUMENT CO., 117 Roosevelt avenue, Beloit, Wis. (at both shows)—the Warner "Auto-Meter," described January, 1907, page 302, and May, 1907, page 144, with recent improvements, described in this issue, page 244.

WINCHESTER SPEEDOMETER CO., INC., Motor Mart, Broadway and Sixty-second street, New York City (at both shows)—exhibited the Winchester speedometer, the latest model of which was described in our September, 1907, issue, page 150.

Tops, Wind Shields, Etc.

THE AUTO ACCESSORIES MFG. CO., 265-269 Jefferson avenue, Detroit, Mich. (at both shows), show their line of wind shields, lamp brackets, etc., as previously described. They also show a new detachable rumble seat designed especially for Maxwell runabouts. This can also be placed on other runabouts of similar pattern. Other new things shown by them are the Duquesne extended front tops for runabouts and touring cars, a one-piece tire holder, which is fastened to running board and does not touch the body; robe and foot rails, lace and button tire covers, and special tire covers to match the paint and trimming of the automobile.

BLUE RIBBON AUTO & CARRIAGE CO., Cannon street, Bridgeport, Conn. (at Madison Square Garden)—automobile bodies, one limousine, one tonneau, one runabout; the latter was described in our May, 1907, issue, page 153, others to be described.

L. C. CHASE & CO., 89 Franklin street, Boston, Mass. (at Madison Square Garden)—"Chase" automobile top fabrics in "Chase Leather" and "Chase Rubber," single and double fabrics, including a large number of styles and patterns.

DUANE & CO., W. J., 304 West Forty-fifth street, New York City (at both shows)—the Schildback divided wind shield, described in our August, 1906, issue, page 140; the Beecher divided wind shield, described in our May, 1907, issue, page 166; the Voltz divided wind shield, described in this issue, page 266; a cape top, described in our March, 1907, issue, page 330; slip covers and a new goose neck body iron, to be described in our next issue.

THE HILL MFG. CO., 25 Fuller street, Buffalo, N. Y. (at Grand Central Palace)—"Hill" bodies, tops, auxiliary seats and wind shields, including a new auxiliary seat, No. 12, and a new body with folding rear seat for high powered runabouts, described in this issue; also a new wind shield.

HOPEWELL BROS., 42 Osborne street, Cambridge, Mass. (at Madison Square Garden)—full line of fabric goods, as described in our February, 1907, issue, page 326; also a line of robes.

KLAUDER, CHARLES L., B street and Allegheny avenue, Philadelphia, exhibit a large line of chrome tanned leather for automobiles.

MUTTY CO., L. J., 28 Summer street, Boston, Mass. (at Madison Square Garden), will exhibit foreign and domestic waterproof fabrics of every description for tops, slip covers, storm covers; also a line of special automobile robes made from "pure rubber interlined" plush and of mackintosh material.

MANHATTAN AUTO TOP VO., 249 West Sixty-fourth street, New York City (at Madison Square Garden)—line of limousine bodies, cape tops, glass wind shields, and detachable limousine tops similar to the one used on Welch cars, to be described.

PANTASOTE CO., 11 Broadway, New York City (at both shows), exhibit an automobile body upholstered in "Pantasote" and fitted with a "Pantasote" top. A tank of water made of Pantasote and containing fish demonstrated the waterproof quality of this material. Samples of fabrics for tops, slip covers, etc., are included, and several automobile seats upholstered in Pantasote, a fabric well known to the trade.

J. M. QUINBY & CO., 27 Division street, Newark, N. J. (at both shows)—Quinby bodies on a "Simplex 30" limousine, a "Simplex 30" touring car, a "Simplex 30" runabout, and a "Panhard" 35 H. P. touring car.

RANDS MFG. CO., 51-55 Macomb street, Detroit, Mich. (at both shows)—Rands tops, lamp brackets, removable tonneau seats, wind shields, etc., late models of which have been described in the following issues of the Journal: February, 1907, page 300; March, 1907, page 344b; June, 1907, page 360, and September, 1907, page 148.

SPRAGUE UMBRELLA CO., Norwalk, Ohio (at both shows)—"Sprague" 1908 tops and wind shields, including the 1908 wind shield, illustrated on page 190 of this issue, and the tops and bow rests, described in our January, 1907, issue, page 234.

SPRINGFIELD METAL BODY CO., 364 Birnie avenue, Springfield, Mass. (at Madison Square Garden), metal bodies in various styles.

TROY CARRIAGE SUNSHADE CO., THE (at both shows), exhibited the Troy combination wind shield, which can be used either as a folding glass front or hub screen, illustrated in this issue, page 190.

Hosted by Google

AUTOMOBILE
art, Boston, Mass., show the Shaw self-sealing
ner tube, which can be used in any clincher
re. The tube is made of two layers of rubber,
ith a layer of plastic compound between them
ree-eighth inches thick. It is claimed that this
mpound will prevent punctures, or rather, seal
nctures of any kind or number.

AJAX-GRIEB RUBBER CO., Fifty-seventh
nd Broadway, New York, N. Y. (at both
ows—1908 Ajax-Grieb wrapt tread tire

COMMONWEALTH RUBBER CO., 1001 Flat-
on Building, New York City (at Grand Central
alace)—the Mitchell punctureless tire, formerly
ade by the Mitchell Punctureless Tire Co., and
escribed in our January, 1906, number, page
6. No material changes in construction.

CONTINENTAL CAOUTCHOUC CO., 43 Warren
reet, New York City (at Grand Central Pal-
e)—full line of "Continental" flat and round
ead tires, and the "Continental" steel studded
re, described in our January, 1906, issue, page
6; also the "Continental" demountable rim, just
troduced to the American trade, to be described
our next issue.

DIAMOND RUBBER CO., Akron, Ohio (at
oth shows)—"Diamond" flat tread, regular
ead, Bailey tread and non-skid tires, includ-
g the new "Diamond Electric" and new "Dia-
ond Mechanical," to be described in our next
sue. The exhibit included the "Marsh" remov-
ble rim, described in our March, 1906, issue,
age 328; the "Diamond" wire mesh base solid
re for commercial cars, described in our May,
906, issue, page 254; the "Diamond" quick de-
achable rim, described March, 1907, page 332,
nd the "Diamond" white rubber truck tire, de-
cribed June, 1907, page 242.

EMPIRE AUTOMOBILE TIRE CO., Trenton,
. J. (at both shows)—"Empire" tires and a
ll line of tire sundries, descriptions of which
ave appeared in the April, 1907, Journal, page
70, and the May, 1907, Journal, page 145.

EMPIRE STATE TIRE CO., 75 Erie County
ank Building, Buffalo, N. Y. (at Madison Square
arden)—tires, tire protectors, etc., described in
ur July, 1907, issue, page 136.

FISK RUBBER CO., Chicopee Falls, Mass. (at
oth shows), are exhibiting the well known Fisk
res with removable rims, which have been de-
cribed and illustrated in various issues. Their
atest devices were described in the September,
907, issue, page 162.

FIRESTONE TIRE & RUBBER CO., Akron,
hio (at both shows)—the "Firestone" dual
read tire, described in our July, 1907, issue,
age 140, improved by corrugation on the treads;
he "Firestone" demountable rim, described at
he same time; the Firestone detachable tire,
being partially flat. A complete descriptio
the new G & J automobile tire will be give
our next issue. They also exhibit their sp
repair kits, tire protectors, etc., which have
described in previous issues.

scribed in this issue, page 220, and the G
year truck tires, described in the August,
Journal, page 188. Their exhibit also incl
the usual line of universal rims with detach
and clincher types of side rings, Bailey t
tires, etc.

HARTFORD RUBBER WORKS CO., Hart
Conn. (at both shows), are making a spec
of the new 1908 Midgley quick detachable
which has the regular clincher rim on one
and the quick detachable device on the o
as is described on page 192 of this issue.
are also showing the Midgley wire tread tire
their regular styles of clincher tires, Turner
rubber tires, and soft rubber bumpers.

HEALY LEATHER TIRE CO., Healy Buil
New York City (at Madison Square Garde
the 1908 Healy leather tire, described in thi
sue, page 203, and the Healy leather motor
tire, described in this issue, page 296; inner t
described July, 1907, page 144, and a new
valve, to be described; also the Healy detac
tire grip, described in our May, 1907, issue,
174.

LEATHER TIRE GOODS CO., THE, Ne
Upper Falls, Mass. (at both shows)—1908 "W
worth" tire tread, described October, 1907,
216; 1908 Kant Skid and new leather inner
described in this issue, page 220.

LONG & MANN CO., Rochester, N. Y
Grand Central Palace)—the "Minute" tire
described in our October, 1906, issue, page
improved by slight changes, to be described;
a new tool for loosening the shoes, to be
scribed; and a new vehicle washer, describ
our next issue.

MOTZ CLINCHER TIRE & RUBBER CO.
ron, Ohio (at both shows), are exhibiting a

corrugated flat and other treads, and also anti-skid style.

ORGAN & WRIGHT, foot of Bellevue street, oit, Mich. (at both shows), are making a ialty of the Midgeley quick detachable rim, improved 1908 model, and they are also ex- ing a new line of hard rubber battery boxes large variety of sizes in any number of bat- s. Also a new line of spring bumpers made olid soft rubber. They also show their usual of detachable and solid rubber tires, which been described from time to time in our mns.

EWMASTIC TIRE CO., Broadway and 68th t, New York City (at both shows)—tires with "Newmastic;" also the "Newmastic" r tube and the "Parker" rim, described in issue, page 270. A feature of the exhibit single tube tire made by joining the edges clincher casing and filling it with "New- ic."

ORRIS AUTO CO., Saginaw, Mich. (at both s), are exhibiting the Standard tire pro- r for the prevention of punctures and blow- It consists of an auxiliary shoe, which a patented bead, which grasps the tire proper out any mechanical fastening, and is dust water tight. Described in the October, 1907, , page 190.

ENNSYLVANIA RUBBER CO., Jeannette, (at both shows)—"Pennsylvania" tires, as de- ed in our January, 1907, issue, page 306, slight changes in materials as detailed in issue, page 202.

NEU L'ELECTRIC CO., New York City (at d Central Palace), exhibit the Pneu L'Elec- tires in several styles, and Grouville & Ar- bourg carburetors.

ESTO DETACHABLE RIM, Lincoln Trust ling, 403 Jersey City, N. J. (at Grand Cen- Palace), exhibit the Presto Detachable Rim, ibed June, 1907, page 212.

EPUBLIC RUBBER CO., Youngstown, Ohio both shows), are exhibiting a new detach- tire and rim, which will be described in next page 168.

TRENTON RUBBER MFG. CO., of Trenton, J., exhibit a complete line of inner tubes f automobile tires, solid and cushion tires; al tire repair stocks for both inner tubes and shoe brake linings, especially made automobile ho

VOORHEES RUBBER CO., 48 Day street, Ne York City (at Madison Square Garden), will e hibit tire repair materials.

Component Parts

THE A-Z CO., 527-9 West Fifty-sixth stree New York ity (at Madison Square Garden)—t A-Z Bulge Square Seamless Tube Radiator, d scribed June, 1907, page 190; metal racing ru about body; hoods, metal racing seat "backet;" metal trunks; gas, water and exhau manifolds, and other metal specialties, describe page 348; February, 1907, Journal; a new radi ter suspension; also several new specialties, i cluding tool boxes, trunks, etc., to be described

AMERICAN BALL BEARING CO., Edgewat Park and L. S. & M. S. Ry., Cleveland, O. (both shows), are exhibiting their well know line of ball bearing axles and hubs, previous described; also the Baker self-aligning thru bearing for propeller shafts, and show sever new axles for the new 6-cylinder cars which a now being placed on the market.

BALDWIN CHAIN AND MFG. CO., 37 He mon street, Worcester, Mass (at both shows are exhibiting a new detachable chain in add tion to their old line of riveted detachab chains. The pins of this new chain are rivete on one side and are held in place on the oth side by a steel collar which fits in the slot in t other end of the pin. The Baldwin & Co. a also showing a line of sprockets which they a now making a specialty of. The new chain w be illustrated in our next number.

BREEZE CARBURETOR CO., 276 Halse street, Newark, N. J. (at both shows), are e hibiting an entirely remodeled carburetor, whic will be described in our next issue. They a also exhibiting a new gasoline strainer, whic was described in our March issue, page 324.

BRISCOE MFG. CO., 1427-57 Woodward ave nue, Detroit, Mich. (at both shows), are exhibi ing their usual extensive line of metal guard bonnets, fans and radiators, which have been de scribed from time to time in our past issues.

BROWN-LIPE GEAR CO., 208 South Gedde street, Syracuse, N. Y. (at both shows)—th well known "Brown-Lipe" differentials, steerin

INEHART CLINCHER TIRE & RUBBER Akron, Ohio (at both shows), are exhibit- he new celluloid tires for touring cars, de- ed on page 203 of this issue. They are also ing their well known Swinehart double tire for trucks, with a chain stretched d the space between the two tires, which only strengthens the tire, but acts as an

ecial drop forgings, prest steel frames, sames of gear steels, valve steels, frame steel, ckel steel, chrome and chrome nickel steel.

CARPENTER STEEL CO., Rooms 1908-10, 100 oadway, New York City (at Madison Square arden)—samples of "Carpenter" steel, deribed in our February, 1906, issue, page 328.

CORTLAND FORGING CO., Cortland, N. Y. t both shows)—complete line of forgings for tomobile tops and bodies, as described in our ay, 1907, issue, page 152, and previous issues, ominence being given to their bow sockets and ifting rails for runabout tops.

C. COWLES & CO., Water and Chestnut reets, New Haven, Conn. (at both shows), are hibiting their usual large line of car fittings, nges, handles, speaking tubes, annunciators, c., among which is a new locking handle for nneau doors. Their specialties have been deribed in past issues.

THE WM. CRAMP & SONS S. AND E. B. CO., each and Ball streets, Philadelphia, Pa. (at th shows)—front axles of "Parsons" manhese bronze, crank cases and gear cases of e Locomobile, bearing castings of Parsons hite brass for the Packard, Stearns, Peerless, ocomobile, Olds and other prominent cars; also w types of gear cases for the Corbin, Columa, Bartholomew, Royal, Rainier, Thomas and ennsylvania cars, and a new one-piece rear le casing of Parsons manganese bronze for the orbin car.

DIAMOND CHAIN & MFG. CO., 241 West eorgia street, Indianapolis, Ind. (at both ows)), full line of "Diamond" chains, the latt types of which are described in this issue, ge 212. The exhibit also included the Diaond steering knuckles and I-beam front axle, scribed in our April, 1906, issue, page 184.

GEMMER MFG. CO., Detroit, Mich. (at both ows)—the "Gemmer" steering gear, latest odel of which is described in this issue, page 4.

GRAY-HAWLEY MFG. CO., 605-609 Fort reet, West, Detroit, Mich. (at both shows)—Gray-Hawley" mufflers, "Autochimes," etc., new atures of which are described in this issue, ge 212; other features have been described as llows: Steam and air valve, September, 1907, ge 154; muffler cut-out and safety valve, Aust, 1907, page 150, and January, 1907, page 6. Also double acting foot pedal, which will described in our next issue.

THE GLOBE MACHINE & STAMPING CO., amilton avenue, Cleveland, Ohio (at Madison uare Garden)—the "Radio-Escape," July, 1907, sue, page 164, and the Globe foot rests and mp brackets, described in our August, 1907, ise, page 168; also a line of brake drums and nds, tool boxes, and other metal specialties.

HANCOCK MFG. CO., Charlotte, Mich. (at both ows)—"Hancock" lubricators, described in our

HARTFORD AUTO PARTS CO., 438 Asy street, Hartford, Conn. (at both shows; re sented by J. S. Bretz Co., sales agents)—"H ford" universal joints, described in our J 1906, issue, page 162, the exhibit including eral new types, the line now including joints the transmission of from 10 to 100 horse po also complete sets, including joints and sh machined to car makers' specifications ready installation in the chassis, in which form Hartford Auto Parts Co. is now making a cialty of furnishing these joints to the trad

HAYES MFG. CO., Maybury Grand avenue G. T. Ry., Detroit, Mich (at Grand Cen Palace), are exhibiting their metal guards hoods well known to our readers; also the m tool and battery boxes, which have lately added to their line. A new exhibit in their is the new metal body with detachable run seat, designed for the Ford four-cylinder about, and adaptable to other runabouts. will be described and illustrated in our issue.

HESS-BRIGHT MFG. CO., N. E. Corner N teenth and Hamilton streets, Philadelphia, (at both shows)—H-B ball bearings, the ex including bearings taken out of various cars have been used considerably, and a set of b ings taken from a railway axle that have run 65,000 miles, and show no perceptible w The constructive features of H-B bearings described in our August, 1904, issue, page 4

HYATT ROLLER BEARING CO., Newark J. (at both shows)—"Hyatt" Flexible R Bearings, which have not been changed s described in our August, 1905, issue, page 7

HOLLEY BROS. CO., 661-673 Beaubien st Detroit, Mich. (at Madison Square Garden)—" ley" 1908 carburetor described in our Aug 1907, issue, page 154; "Holley" 1908 stan magnetos and a special "Holley" magneto for Ford Runabout to be described in a future is

HYDRAULIC PRESSED STEEL CO., Clevel Ohio, (Grand Central Palace) exhibited prest frames, brake drums and other prest steel p described in the June 1, 1907 issue, page 18

INDESTRUCTIBLE STEEL WHEEL CO., Michigan Boulevard, Chicago, Ill., (at Mad Square Garden) "Indestructible" steel wh commercial type described in our October, issue, page 184, and the new pleasure car, pattern described in this issue, page 228. T wheels were also exhibited on demonstrating as standard equipment.

JOHNSON, ISAAC G., & CO., Spuyten Du New York (at Grand Central Palace), exhi a number of samples of their direct steel cast which are used for crank shafts, connecting front and rear hubs, foot brakes, radius sprockets, gear cases, etc.

Digitized by Google

e S & B variable speed transmission described our March, 1907, issue, page 296.

KROUSE, R. E., 8612 Main Park avenue, veland, Ohio, (Grand Central Palace) exhibited Krouse Carburetor, which will be described in uture issue.

THE LIGHT MFG. & FOUNDRY CO., Potts-n, Pa. (at both shows), are exhibiting a large nber of difficult castings in their well known to Brand Aluminum; also a number of parts Manganese and Phospho Bronze. They also w some special parts made of their plastic nze. These products were described in detail our March, 1907, issue, page 168.

MERCHANT & EVANS CO., 517 Arch street, iladelphia, Pa., (at both shows)—The Hele-aw clutch; the "Evans" cnange speed gear; Evans back axle; the "Star" metallic tire e and samples of steels which they are im-ting. The clutch and other parts are briefly cribed in this issue, page 207, but will be cribed in detail and illustrated in a future ue.

METAL STAMPING CO., 30-50 Hubert street, w York (Grand Central Palace) exhibited a of radiators and brass car fittings, including ndles, curtain fasteners, etc. Radiator de-ibed March, 1907, issue, page 284, and cur-n fasteners September, 1906 issue, page 126.

MIDGELY MFG. CO., Dublin avenue, Columbus, o (at both shows)—"Midgeley" tubular steel eels described in the February, 1904, Journal, e 160d; the 1908 Midgeley universal rim, de-ibed in this issue, page 192; also samples of ctric welded work produced in their new plant ently erected for this purpose.

MUNCIE AUTO PARTS CO., Muncie, Ind. (at dison Square Garden) Selective and Progres-transmission gears, control and brake levers, e clutches, steering wheels and glass, uni-sal joints and parts for same.

MORTON CO., THE, Worcester, Mass. (Grand tral Palace)exhibited their crank shaft grind-machines, also a large number of crank fts which have been ground on these machines. y supply the machines and also supply the chined crank shafts. This company also ex-ited a large variety of shapes in which they ply alundum, which is a grinding compound ch they supply to the trade.

HINEAS JONES & CO., 301-311 Market Pederson oilers, including the new Type C, wh is described and illustrated in next issue, their Type LI, described in our May, 1907, iss page 128.

PRECISION APPLIANCE CO., 832-840 Au avenue, Chicago, Ill. at Madison Square G den), will show the "Hill" precision oiler i variety of types; also one fully equipped au mobile dash, showing their dash oilers, se rate sight feeds, and separate sight tests; oilers in chassis in full operation, distribut the oil not only to bearings, but also to an luminated plate glass foot-board.

PROSSER & SON, THOS., 15 Gold St., N York City (at both shows), exhibit a large sortment of parts made of "Krupp Spe Steels," of which they are the importers.

SCHWARZ WHEEL CO., Twentieth and Gl wood avenue, Philadelphia, Pa. (at both sho —"Schwarz" wheels in all types for both ple ure and commercial cars from the lightest r about to trucks of 5 or 6 tons load capacity. change has been made in the construction this wheel since described and illustrated in December, 1904, issue, page 196.

SHELBY STEEL TUBE CO., Frick Buildi Pittsburg, Pa. (at both shows)—various parts automobiles made of "Shelby" steel tubing, s as coils for steam boilers, front and rear a tubes, steering columns, telescoping operat rods, etc., the newest feature of the "Shel exhibit being a seamless steel engine cylin shown to suggest to designers the possibili of seamless steel for this purpose.

STANDARD WELDING CO., Central ave and Seventieth street, S. E., Cleveland, Ohio both shows)— numerous types of special tachable, demountable and mechanically faste rims for automobile tires, special shaped ba and flanges, the G & J motor cycle beaded e clincher rim, tubular steering wheel, chuck ri or gear blanks, muffler and exhaust tubes, de onstrating their seamless steel products f nished on contract; also a line of electrica welded parts to show the work of this dept.

SPICER UNIVERSAL JOINT MFG. CO., Ma son avenue and West Third street, Plainfie N J. (at both shows)—the 1908 spicer univer joint, which has been improved to make it m dust proof, to be described in an early issue.

Digitized by Google

STANDARD BRAKE CO., 101 West Fifty-sixth street, New York City (at both shows)—"Standard" metal to metal brakes and clutches, described in our July, 1906, issue, page 128, and "National" cork inserts as used in automobile brakes and clutches, the exhibit including samples from various makes of cars using the cork inserts, which were described in our May, 1906, issue, page 182.

STANDARD ROLLER BEARING CO., corner Fiftieth and Lancaster avenue, Philadelphia, Pa. (at both shows), full line of ball and roller bearings, such as described in our April, 1907, issue, page 142, and the new "Grant" roller bearing, described in this issue, page 210.

SHALER, C. A. CO., Waupun, Wis. (at both shows); 1908 line of "Shaler" electric vulcanizers which includes a variety of new types described in this issue, page 188.

SHERWIN-WILLIAMS CO., THE, 601 Canal Road, N. W., Cleveland, Ohio (at Madison Square Garden), automobile colors and finishes.

SPRINGFIELD PORTABLE CONSTRUCTION CO., Springfield, Mass. (at Grand Central Palace), exhibit one of their portable garages, also a working model showing their method of construction.

STOKES RUBBER COMPANY, JOSEPH, Trenton, N. J., exhibited a line of hard rubber goods, including steering wheels, handles, motor cycle grips, radiator caps, battery jars and cases, etc.

TURNER BRASS WORKS, Sycamore, Ill. (at both shows). The Harroun Auto Bumper, described on page 140, issue of July, 1906; Martin reserve and safety alarm described January, 1907 issue, page 290; Martin fuel strainer, described page 222, this issue; the Turner safety alarm pump, described July, 1906, page 136; the Turner carburetor, described March 1903, issue, page 72; Turner name plates, aluminum castings, coat rails and foot rails.

VALENTINE & CO., 257 Broadway, New York (at Madison Square Garden)—automobile varnishes and colors; also a large assortment of various colored panels and glasses, showing stripings, in order that the automobile buyer may get a clear idea of just what color his car will be when finished, and will materially aid him in the selection of the shade he has in mind.

VENTILATED CUSHION AND SPRING CO., Jackson, Mich. (at both shows), are exhibiting the Rough Rider cushion spring and ventilating cushions, described May, 1907, page 141.

WOOSTER, WILLIAM, 88 Chambers street, New York City (at Grand Central Palace), exhibited a large line of automobile accessories, for which he is agent.

WRAY PUMP & REGISTER CO., 191 Mill street, Rochester, N. Y. (at Madison Square Garden)—Wray pumps and pressure registers.

WEED CHAIN TIRE GRIP CO., 28 Monroe street, New York City (at both shows), are exhibiting the well known Weed Chain Tire Grip, with which they now supply a new device called an adjuster, which keeps the chain taut, preventing it from coming in contact with the guards. They also show a new solid tire device, which is applied in similar manner to their regular device, but which is equipt with chrome nickle steel plate on the tread. These two new devices will be described in our next issue.

AUTOMOBILE CLOTHING

COHEN, FRANK & CO., Brooklyn, N. Y., exhibit the Arygle auto boots for cold weather motoring.

MANN CO., LEON, 699 Broadway, New York City(at both shows), exhibit an extensive line of automobile clothing.

MORRISON, McINTOSH & CO., Grinnell, Iowa (Grand Central Palace), exhibited a large line of Grinnell ventilated air cooled Rist-Fit gauntlets, including a new style, which has a slide snapping buckle, making a very quick and neat fastener. Illustrated on page 263, this issue.

REGAL COAT COMPANY, 36 East Twelfth street, New York City, exhibit automobile coats made of high-grade "Lucenta" satin, cravenetted and rubberized. This material has a rich lustrous finish and is furnished in a large variety of colors.

Two dollars sent now to the Cycle & Automobile Trade Journal, Forty-ninth and Market street, Philadelphia, will assure your getting the December and eleven other succeeding issues of the Journal. As the descriptions of 1908 cars constitute a special feature of the Journal at this time of the year, no issue should be missed.

Hosted by Google

ctured by the Blomstrom Manufacturing mpany, Detroit, Michigan, was two rs, a five passenger touring car and a ree passenger runabout, same chassis d same price, $2250. This same line of rs, a five passenger touring car and three passenger runabout, one chassis ly, will be continued for 1908 under the me name, The Blomstrom "30,", and at e old price $2250, altho the 1907 assis has had detail improvements ade, notably an increase in cylinder nensions from 4 3-16x4½ in 1907 to ⅛x4½ for 1908, which gives something e 5 H. P. more than the Blomstrom 1907

is two completed cars per day, and expected total 1908 production is ab 200 Blomstrom "30" cars, 125 or 130 passenger touring cars and 70 to 75 passenger runabouts.

The Blomstrom "30," 1908 5-passen touring car has a wheel base of 112 inch gage 56 inches, and tires all 32x3½ inch The motor has four cylinders, 4⅝x inches, 4-cycle, water-cooled, nominal H. P. Sliding-gear speed-change, 3 f ward speeds and a reverse with be gear to the divided rear axles are us The weight is 2250 pounds and the pr $2250, including 5 lamps, mats, horn a

Fig. 1. 1908 Blomstrom "30" three-passenger runabout. An increase of six inches has been de in the wheel base, and the motor has been increased from 4 3-16 by 4½ to 4 5-8 by 4½ hes. The body is practically the same as in 1907. The wheel base is 112 inches; gage, 56.3 l tires, 32x3½ inches; weight, 2100 pounds; price, $2250, including five lamps, mats, horn and ls.

0" motor, altho the "30" is retained in 08 for advertising purposes. The chas- wheel base has been increased from 6 to 112 inches, giving 6 inches more ngth to the tonneau-floor and permitting increase in the tonneau-door width. e 3-passenger runabout body is car- d over to 1908 without change, other an increase of length due to the added inches of wheel base.

This company is making its own four- linder motors. The cylinders are cast dual-units and are of such proportions to make the connecting rods symetrical, th the rod-bodies in the middle of the ist-bearings. This somewhat increases e motor total length, but greatly im- oves the wearing qualities of the con- cting-rod boxes.

The Blomstrom factory has been aug-

tools, all ready for the road. The ca top is $100 extra.

The Blomstrom "30", 1908 3-passen runabout has the same chassis specifi tions as the touring car. Its weight 2100 pounds, and the price $2250, includ 5 lamps, mats, horn and tools, ready the road. The cape top for this Bl strom "30" runabout is a recent desi reaching far forward in front, but hav only two bows. The price of this top shown is $90.

NOTABLE FEATURES.

These 1908 Blomstrom "30" cars are last thing in motor car design thru C. H. Blomstrom is one of the most perienced of motor car builders, and designs are of carefully selected deta from accepted practice, with many origi features of decided merit. The clutch

Digitized by Google

Fig. 2. Plan of 1908 Blomstrom Chassis, showing the sub-frame, the enclosed clutch, an e forked forward end of the cardan shaft housing, which acts as a torsion rod.

le way either to the front or rear, nds between two-grey-iron, beveled mbers, which are pinched by toggles l bell-cranks against the bronze-ring el faces, as shown in Fig. 3. The y-iron clutch member inclined faces fitted with cork inserts, giving a soft gagement and a powerful slipping drive. The touring car bodies are "straight e" effects, with wide doors and ample m. The runabout body has the front rd deeply cowled with sheet steel and cowl sides are continued to the front t panels, so as to enclose the driver's t-space at the sides without the placing doors.

The sliding gears are by Warner, the ering action is worm and worm-gear tor and the springs are half-elliptics in nt, and full-elliptics in the rear. The peller shaft casing is in integral assem- with the bevel-gear housing at the r and has a long fork at its front which is jointed at each side to the ssis-frame cross-girt brackets, in line h the single universal-joint between line-shaft and the propeller shaft.

The axles are all tubular, by the Weston tt Company. The front wheels are on circles of balls in adjustable 3-point rings. The divided axles are on Hyatt ers and have the driving wheels keyed their tapered outer ends with hex nut ension. The propeller shaft is also on att rollers at both ends, bevel pinion ust taken by a disk ball-bearing. The r balance-gear has ball-disks at each .

THE SPRINGS.

The front springs, half-elliptics, are 38 nes long by 2 inches wide, 7 leaves, ded at each end, tongued and grooved, ted forward and linked in the rear. rear springs, full elliptics are 38

The chassis frame is prest steel, inches greatest side depth. The mot and sliding-gear box are placed on a su frame. The chassis frame is 34 inch wide, with sides straight and parallel.

Fig. 3. Mid vertical section of 1908 Blom trom "30" clutch. The clutch is normally e gaged by a coiled spring, which pushes the sli ing toggle member forward and so actuates t three bell-cranks which pinch the front and re clutch disks, fitted with cork inserts, against t bronze ring 17 deg. internal faces, placed b tween the two co-acting grey iron clutch me bers. The bronze clutch ring is slipt on t cylindrical studs projecting rearwardly from t fly-wheel, so as to freely adjust itself to equ contact with the two grey iron clutch member

supply.

CONTROL.

e spark and throtttle are governed atchet-retained levers on top of the -wheel. Steering is by a worm and n gear sector. There are two outside rs, both latched. The outer lever n pulled backward first disengages clutch and then applies the external gear-shift rocker, as may be, when the hand-lever is rocked sidewise, after which forward or rearward movement of the hand-lever effects the desired gear-shift The foot board has two pedals only; that on the left is pushed forward to disengage the normally spiral-spring applied clutch The right pedal is pushed forward to apply the internal, ordinary brake-shoes.

Lane Steam Roadster

e exhibit of the Lane Motor Vehicle pany, of Poughkeepsie, N. Y., shows gh-powered roadster and a 7-passenger ng car, with identical chasses, motor pound, cylinders 3-⅞ and 6-¼ inches, by 4 inches stroke, fire tube boiler, pounds working pressure, 30 to 120 ., also a 5-passenger touring car, and passenger runabout on a different sis, motor compound 3-¼ and 5-¼ es, cylinder bores by 3½ inches ke, fire tube boiler, 325 pounds working sure, 20 to 50 H. P.

e Lane motive assembly includes a e, vertical,tube air-cooled condenser in , which returns 90 per cent. of the r to the boiler. The price of these steam cars ranges from $1800 to , and the outside appearance of the is made to conform to that of the nary gas engine driven vehicle. The consumption is from 7 to 12 miles to the gallon, with from 4 to 8 miles to the gallon of water supply.

The Lane water and fire control are wholly automatic, no pumps fitted for hand use, while the motor is working which makes it possible to assert that the steam drive is a most convenient and reliable for motor car service.

This is the second New York show number. The December number will be the Chicago show number and will contain in addition to descriptions of all new things at the Madison Square Garden Show not described in this issue, a forecast of the Chicago show. The January number will be the Eighth Annual Buyers' Guide Special and each succeeding issue will have some special features. You cannot afford to miss any. If not a subscriber send $2 at once to the Cycle & Automobile Trade Journal, Forty-ninth and Market streets Philadelphia, Pa.

site, 100x600 feet, Ashland avenue and Thirty-seventh street, Chicago, and now has a two-story and basement steel and concrete factory, 65x400 feet in process of construction, which will be ready for occupancy in August, 1908.

The factory and offices are now located in the old Morgan & Wright factory and office building, 15 to 21 North May street, Chicago.

Work was begun on the 1908 Model E car, here first shown and described, about June 1st, 1907 and the first one was placed on the road about August 10th, 1907.

In Fig. 1 is shown this new Model E runabout. The wheel base is 84 inches gage, regular, 57 inches for middle west trade, and 60 inches for the Northwest and South. The wheels are 40 inches diameter front and 44 inches rear. The tires are all solid 1¼-inch Firestone. The motor, is a pair of opposed, 4-cycle, water-cooled 4¾x4 inches cylinders, nominal 12 H. P. The engine is set cross-wise under the hood, with "Gaeth" type of clutch to the line shaft and a two-forward-speeds-and-reverse sliding-gear to the counter-shaft bevel gear, with an 8-spur-pinion balance-gear to the divided sprocket shaft. Diamond roller chains, 1-inch pitch drive to the rear wheels, which have 10 inches diameter internal bronze rear-hub-drum brake-shoes, 2½ inches face. These bronze brake-shoes are about ¼-inch uniform thickness throuout, and are cam-rocker expanded. The regular body is of the covered buggy type, to seat two passengers.

The Reliable Dayton chassis frames are

not shown, $50.00 extra. Acetylene and gas-tank will be furnished to chaser's order at prices agreed upon. same model with a special coupe bo also furnished. The chassis is the

as in Fig. 1, weight about 1200 po With this body the price is $1200, i ing three lamps, mat and tools.

The Model F is a surrey, the whee is 98 inches, and save for some inc of weight at certain points the chas

Fig. 2. Model F Reliable Dayton is a Surrey somewhat heavier than Model E, but the same motor and chassis arrangements. The wheel base is 98 inches, weight, 1400 po The price, with lamps and tools, is $925; surrey top, as shown, $50 extra.

Digitized by Google

Upon the same chassis a light delivery wagon, Model G is constructed, but is somewhat heavier all thru. The wheel base is 98 inches, gage 57 inches, the front tires are 36x1⅝ inches; Firestone, solid, and the rear tires are 40x1¾ inches Firestone. The motor is a pair of 5x5 cylinders, set crosswise under the drivers seat, and develops 18 H. P. A sliding-gear speed-change giving two forward speeds and a reverse, transmits power to the divided sprocket-shaft, and 1-inch pitch Diamond roller-chains, drive to the rear wheels. This wagon has a paying load capacity of 1500 pounds and weighs about 1800 pounds.

Fig. 3. 1908 Reliable Dayton Counter Shaft and Sliding Gear. This change speed gives two speeds and a reverse. The gears are 6 pitch. The jack shaft is supported on Hyatt Roller bearings. All the gears and the differential are housed in an aluminum housing integral with the jack shaft housing the whole, forming what the manufacturers claim to be the most expensive single piece of mechanism in any carriage type of automobile.

The price is not yet decided upon. The regular equipment will be three oil lamps and tools. Everything else extra.

NOTABLE FEATURES.

Up to these 1908 models, the Reliable Dayton cars have had angle-steel chassis-frames. This has been changed to wood as the stronger, lighter more elastic and more generally suitable material. The particular wood preferred is second growth ash. The corners are held with an outside, right-angle plate, which has a bottom member under the two pieces of wood, and a separate inside angle iron.

In the 1908 car a two speed sliding gear is used, instead of planetary. All wheels are on Timken roller bearings. Both the front and rear axles are solid square steel forgings, 1⅛ inches square in front, and 1¼ square in the rear. The use of rack and pinion steering is also new this year. All the cars have screw adjusted struts, flat joints front and rear. The passenger cars carry their opposed motors under the hood in front, instead of under the body, as formerly. The fuel-tanks of 10 gallons capacity are under the driver's seat. The delivery car has the motor under the driver's seat and carries the fuel tank, 15 gallons capacity, in the rear of, and below, the driver's seat.

SPRINGS.

The springs are all half-elliptics in front, and scroll-head full-elliptics in the rear. The passenger car front springs are 36 inches long by 1½ inches wide, and are jointed in front and linkt in the rear. The rear springs are fixt on the rear axles and revolvably connected to the chassis frame brackets on top. Model E springs have 5 leaves, and Model F springs have 6 leaves.

The delivery wagon springs are half-elliptics in front and full-elliptic in the rear, all springs fixt to the axles. The rear springs are revolvably attached to the chassis-frame brackets. These springs are 36 inches long by 2 inches wide, full-elliptics, 6 leaves.

The chassis scheme places the motor forward and cross-wise, has a modified "Gaeth" clutch between the motor and line-shaft and places a change-gear in a box integral with the aluminum counter shaft housing, as shown in the illustration of the counter shaft construction plan.

The steering is rack and pinion, vertical shaft and steering post. The passenger cars change-gear lever is horizontal and mounted on the steering post, Pierce Great Arrow fashion. The truck changes the gear by an outside, latched hand-lever.

CONTROL.

The steering is by side lever and rack and pinion, vertical steering post. The spark and throttle are controlled by two vertical rockers, outside of the steering post, to which ratchet-retained, horizontal hand-levers are fixt close under the hand-wheel at the rear of the steering-post. The foot-board has two pedals, the left pedal disengages the clutch, which is automatically applied by a 100 pounds coiled spring of 100 pounds tension, when the pedal is released.

Hosted by Google

The right hand pedal applies the rear-hub brakes only. There are no brakes save the internal, hub-drum shoes.

THE 1908 CLUTCH.

The illustration herewith given so fully shows this clutch construction as to make an extended description needless. The two half-bands, lined with metal or with fibrous material, are applied by two levers pivoted on one arm of a hub keyed to the line-shaft; the other arm, opposite the first arm, extending outside of the clutch drum circumference and supporting the fixt ends of the two, constricting half-bands. The half-bands are forced into contact with the cylindrical exterior clutch drum by two levers having their short arms jointed to the free ends of the half-bands, while their long inner arms pass the shaft center and impinge the surface of the sliding cone, which forces the inside ends of the levers apart to engage the clutch by powerfully forcing the outer short arms of the levers to approach each other. The cone may be forced to the left by a heel-and-toe pedal, or by a 20 pound coiled spring surrounding the line-shaft. Gaeth uses no spring; the Reliable Dayton clutch uses a 20 pounds compression, clutch engaging spring, not shown in these illustrations, which forces the clutch-cone to the left.

When the clutch-cone is at the left extreme, the clutch is fully applied, the inner ends of the applying levers being separated to the widest extent. With the cone at the extreme right, the inside ends of the levers approach each other, separating the lever outer ends to the extreme, and so disengaging the clutch bands. To adjust the clutch, Gaeth filled the spaces at S, S, see clutch illustration, with washers, more or less in number as the half-bands needed for best effect. The Reliable Dayton places coiled springs in these spaces as shown, and adjusts the clutch by the bolt, nut and check-nut, shown with the springs mounted on the bolt body. It seems better to use the washers surrounding the bolt in the spaces, S, S, and pull the nut up hard.

This general form of clutch is the simplest, lightest, least costly and best in action yet noted by the writer. Most designers would probably prefer the coiled spring and normal automatic engagement as here shown, to the original heel-and-toe pedal action with no spring at all. One arrangement is about as low-cost as the other, and both work to perfection.

The only possible objection to this clutch is its exposure to dust, but with the fly-wheel cased in, as is done in some 1908 cars, and should always be done, this solitary objection dissappears. This form of clutch gives the largest exterior diameter cylindrical clutch face possible inside of the circumference of a given diameter fly-wheel, and so gives the greatest clutch-drum radius without exceeding the fly-wheel diameter for any part of the fly-wheel and clutch assembly. This condition means that the Gaeth clutch can be so constructed as to demand only the lightest possible brake-band surface-pressure for a given width, to transmit a given H. P. This clutch also places a very light weight on the line-shaft, and is extremely low-cost construction.

Fig. 4. Reliable Dayton 1908 Clutch. External contracting band, camel's hair lined. The original and unique features of this clutch are described in detail in the text.

THE STEERING GEAR.

The Reliable Dayton goes back to the vertical steering post, with a rack and pinion steering action, and a horizontal change-gear lever, mounted on the steering post. This construction has many advantages, but does not look right to eyes accustomed to the steering hand-wheel.

THE COUNTER-SHAFT.

The frame work is a widely flanged aluminum alloy casting, divided in the horizontal plane of the shaft axles. The bevel pinion shaft is in a 4-point ball bearing next to the pinion; the change-gear is also housed in this counter-shaft casing, with the side shaft on plain bearings. Everything else is on Hyatt rollers, and the balance gear is 8 spur-pinions, with ball thrust bearings for the bevel gear,

frame strongly trussed. The bonnet is

Fig. 3. Section of 1908 Columbia Engine Cylinder, showing the complete water jacketing of the exhaust valve chamber.

made of top piece strongly bolted down with bodily removable side pieces set in gutters and bolted to the top section. The lamp props are braced to cooler support and all irritant small noises suppressed.

THE ENGINE.

In the engine of this new car the cylinders are cast in pairs, 5½x5½. The valve chambers are located with least possible cubical area combined with absolute and uniform water jacketing of the exhaust valve seat and guide, as shown in the sectional view. The inlet valve guide, too, is lubricated to prevent bending, breaking and sticking of the valve stems. The spark plugs are set between the inlet and exhaust valves, are water jacketed and in the path of the incoming gas. The

located below the frame line. The v inlets operated by walking beams, easily accessible on the same side.

The ignition is of high tension type single coil and auxiliary to distri and timer, making four steel contac one time, so constructed that ne primary or secondary wiring moves the spark is advanced or retarded high tension Gianoli magneto is also vided, making thus two systems of tion using a common distributor and mon set of plugs. The oiling is mecha with a sight feed tank on the dash leads to each cylinder and main e bearings. The engine also enjoys a plete splash oil system, all catch b being piped to bearings and the webs having all leads to connecting bearings operated by centrifugal forc well as scoops and provision is also for the return of oil from end engine ings to the crank case, a common se previous trouble. The cam shaft i from the solid and the cam gear is fla on, and driven thru studs as in fly- practice, making for absolute quiet. sure of cam rollers is maintained ag a film of oil overcoming another co cause of noise.

THE LIGHT COLUMBIA.

The make and break engine light cylinder car has has had many and impo changes inaugurated for 1908. Th gine has been increased in size now 4½x4½, and rated 28 H. P., A. L. The water jacket areas have bee creased as well and the make and

Fig. 4. New Cardan Shaft, with two splines running in key ways.

firing holes decreased in size. The engine gears have been encased an run in oil. There is a new arrang of the water piping, and improveme the carburetor have been made.

The transmission now has Hess-l bearings thruout; the wheels have

W COLUMBIA ELECTRIC PHAETON.

new Columbia Electric Victoria on with very much greater speed, room and mileage capacity is an-ed, of new chassis construction, as as an inside operated Coupe. This car has 32 cells of Oxide battery dis-ed over both axles, a ball bearing which have much more severe use, and so are known to be over strong for electric vehicle use. The controller is of special design with continuous torque, five forward speeds and two reverse.

This new car has a speed of 20 miles an hour. Standard tires are pneumatic, but the vehicle is sufficiently strong for the use of solid rubber tires.

1908 Mora Cars

e Mora Motor Car Company, of rk, New York, offers for the season 08 a line of four-cylinder cars very ly changed from 1907 models, and a six-cylinder chassis, the base of two models, a touring car and a "Racy-

e 4-cylinder cars are known as the er" and "Racytype," each with r chassis. The Tourer seats five, wheel base of 103 inches, tread 56 s, and is fitted with 4 by 32-inch The combination wood and steel

CHANGES.

The four-cylinder engine is still built with marine type bearings, but where the boxes were previously made of all bronze, they are now made of malleable iron and nickel Babbitt bushed. The timer is located upright forward instead of at the side, and the carburetor is on the left instead of the right side. The lines of the body of the Tourer have been slightly changed, but the general dimensions are the same as heretofore.

The six-cylinder cars are new and will

'ig. 1. The Six Cylinder 1908 Mora "Tourer." This new model has the following specifica- Six cylinder Motor; 4 inch Bore; 5⅛ inch Stroke; 42-50 H. P. Seating Capacity, Five. le brakes of the internal and external type on the rear wheels; double ignition system, sting of LaCoste Magneto, LaCoste Coil and timer. Weight, 2,500 lbs. Wheel base, 114 s, tread, 56 inches; tires all 36x6. Price, $3,600; with Extension Mohair Cape Top, $3,775.

s are continued for 1908. The four-er motor has 4-inch bore by 5⅛-inch e, and is rated as 24 H. P. A three and one reverse change speed of sual sliding gear type is used. The is $2200, and with an extension pan-top $2310.

"Racytype" seats three and has the chassis specifications with few ex-ns. The wheel base is 98 inches he wheels are fitted with 32 by 3½-

be shown for the first time at the Automobile Club of America Show. The cylinders are of the same size as used in the four, but the engine is supplied with annular type ball bearings for the crankshaft and the cam-shaft and gears. The change speed gear is of the selective type, and also has annular type ball bearings. The front axle is "I-beam" and rear axle is the full floating type.

The wheel base of the 6-cylinder chassis

Hosted by Google

band brakes are provided on the rear wheel drums. The frame is of prest steel contrary to the usual custom of the Mora Company.

The six cylinders are rated as 42-50 H. P. Jump spark ignition is used, the source being by battery and also magneto. The change speed gear, as in the other models, is of the sliding type, giving three forward speeds and one reverse, operated on the selective principle. The "Racytype" model is finished in cadet gray and has a seating capacity of either two, three or four people. The body is wood, as are the other Mora cars, well finished. The "Tourer" is similar with the exception of the body, which has a seating capacity of five and weighs 2500 pounds, whereas the smaller six-cylinder model weighs but 2250 pounds. The wheel base of the "Tourer" is somewhat large being 114 inches, and the tires are extremely large, being 36-inch by 6 inches. It will be noted that these are much larger than called for by tire makers, when the weight of the car is taken into consideration, and it will, therefore, show exceptionally long life. This machine carries an 18 gallon gasoline tank while the smaller car is fitted with a 17 gallon tank. This car is shown in Fig. 1, from which it will be seen that the bonnet is not exceptionally large, in fact not larger than many of the four-cylinder cars. The outline of the smaller six-cylinder car which is shown in Fig. 2 is an idea of the up-to-date Racy line of this new model. The price of the touring car is $3600 without top, and $3775 with extension mohair top.

SPECIAL MORA FEATURES.

The special features claimed for the 1908 line of cars by the manufacturers are light weight in proportion to the power, the use of double independent ignition and unit power plant with interval mud-proof pan, and extremely easy riding qualities due to the heavy front spring and springs of the platform type at the rear, making points of suspension central instead of at the ends. Claims of superiority are also made for the marine type of bearings in the motor and transmission. In the six-cylinder cars the use of F. & S. ball bearings in the engine crank-shaft, cam-shaft, and in the change speed gears is pointed out also the fact that the car has very large wheels and tires, giving liberal road clearance. The unit power plant, double ignition of LaCoste magneto and LaCoste coil and timer are also features of merit. On the six-cylinder "Racytype" the rear springs are of the full platform type, that is, there is also a cross spring at the front of the side springs as well as at the rear, which it is claimed makes the car capable of traveling exceedingly uneven roads without twisting the frame as the springs compensate for the uneven road surface.

Fig. 2. The 1908 "Racytype" Six cylinder Mora. Chassis specifications similar, with few exceptions, to the "Tourer." Seating capacity, two, three or four people. Wheel base, 105 inches, tread, 56 inches. Tires, 36x3½. 42-50 H. P. Same Ignition and general arrangement as the large car. Weight, 2,250 pounds. Price, $3,500 without top.

Babcock Electric Carriage Company will open a branch in New York City at 1591 Broadway, cor, Forty-eighth street.

The Cadillac Motor Car Company, of Detroit, Mich., will equip its 1908 output with the Midgley universal rim and use as the tire equipment the products of the Hartford Rubber Works Co., the Morgan & Wright and G & J Tire Company.

Over half a hundred 1908 cars have been described in the reading pages of the Journal, besides those described in this number. Many more descriptions of 1908 cars will appear in the December and succeeding issues. To insure your regularly receiving the Journal and avoid missing this and its numerous other valuable features subscribe now. s the result, it is claimed, of many of automobile experience; the con-ions being those shown to be cor-by experiments in a well equipt ıtory by competent engineers. The point claimed for the new car is ct that the very best material com-e with its selling price has been The statement is made that the orth car holds no material in its up of any character, excepting the l grades of die forged alloy steel s chrome nickel, chrome and chrome ium steel.

steel of artistic appearance, great strength and symmetry.

The chassis frames are of special "Krupp" chrome nickel steel. These members are 120 millimeters deep—nearly five inches—possess extraordinary rigidity, and it is claimed are unbreakable. It was the aim of the Ellsworth designers to make every part of such fine material that under no circumstances, would the parts rupture, altho they might deform in a collision. The only way this can be done is by employing materials which will not show signs of rupture when bent 180

'ig. 1. The Ellsworth Patented Built-up Crank Shaft. This shaft is provided with annular bearings, and so constructed of chrome nickel steel in sections that each throw is inde-ently supported by the bearings.

necessary deviations from these cts are as follows: Cylinders, of cast iron; gear and crank cases of num alloy or steel-bronze at the of the purchasers; fly-wheel of ronze, and pistons of gray cast iron.

GENERAL DESCRIPTION.

Ellsworth automobile is of the con-nal four-cylinder motor type, with otor mounted in front; on the chas-rame—without the use of a sub-—so set that the motor does not l in front of the front axle; in fact, ooler of the square tube type is so that its front face is on a line the front axle. In this way the t of the motor is between the two This also improves the steering car.

transmission is of the four speed ve type, direct on the high gear, enclosed differential gears of the

degrees, and flattened under a steam ham-mer.

BEARINGS.

All bearings are of the annular ball type, including the crank-shaft and the cam-shaft, only the connecting rod ends are plain bearings. The respective ball bearings are housed in and separately lubricated, and their sizes are in every instance "in excess of the conservative ratings of the makers."

The thrust loads are taken on thrust bearings. The wheel hubs are of alloy steel and the ball bearings are therefore backed up by a hard resistant metal, instead of cast iron as is often the case. The ball bearings are especially large and well mounted; moreover they are fitted with safeties.

The single cam-shaft does not pass thru the motor case but does pass across the top of the cylinders, in a sepa-

Digitized by Google

r the respective members of the crank haft may be done with great accuracy by nen of average skill. The ball bearings re fitted directly to the crank members ithout the intervention of any separate acking member. The joint comes so hat the respective throws are indepen- ently supported by the ball bearings, and he "torque" (double taper non-bottoming) ins, are not required to perform a double

they might seem to be.

The cars will have various weights cording to bodies and equipments, but maximum weight will not exceed nine hundred pounds. This weight conside a forty horse-power motor settles the q tion of hill climbing ability. The stan equipment consists of Continental 920 mm. by 120 mm. for both front and rear wheels. The reserve ab

Fig. 2. Some of the Ellsworth Car chrome nickel steel parts with flanges. All flan wherever possible are an integral part of the members.

ervice, as is usually the case. The crank- haft may be disjointed at will without he use of any special tools, and the ball earings inspected. No skill is needed to ake the crank-shaft apart, nor can any nistake be made in assembling.

If a throw is ruptured it can be re- laced quickly, instead of requiring an en- irely new crank-shaft. However, this rank-shaft is guaranteed against breakage rom any cause in service, and any part f it that does fail in service will be re- laced free of any expense. The ball earings will have a long time guarantee laced upon them.

The magneto, timer, carburetor, spark- oil, Speedistimeter and time-piece in he Ellsworth car are all in a water tight ousing, forming the dash-board and ac- essible from the seat at will. What otorist has not used bad language when he timer of his car (located under the ood) filled with muddy water and re- used to work? or who can say he has scaped carburetor trouble from the same ause? This arrangement absolutely pro- ects all these delicate parts, and at the ame time places them in a more ac- essible position.

To attain these advantages the cam- haft was designed to pass over the top

considering the low weight of the ca very large. Because the front and tires are the same size, considerable economy will result.

Fig. 3. The Ellsworth Rear Wheel and S ing Link. Attention is called to the fact the sprocket drums are of special auto and the link, as all other parts of the ste mechanism, is particularly sturdy.

THE CLUTCH.

The clutch is of a special patented sign. It consists essentially of a harde

Hosted by Google

suitably heat treated to afford the iisite qualities. The clutch runs in nd requires no adjustment at any time. s said to behave nicely, can be made lip at will, holding like "grim death" n the members are in full contact.

THE BRAKING SYSTEM.

esides the regular "differential" brakes the "emergency" brakes the car is pt with "auxiliary differential brakes." brake drums are heat treated and of ial auto steel with large surfaces. The e bands are of special auto steel lined pure annealed copper, with ready effective means of adjustment. The lization of the emergency brakes is cted without introducing an inertia ponent such as follows the use of lizing bars, but the brake cable used not thread thru a tube and therefore not "bite" or bind on the abrupt s. The side levers and foot pedals are hrome nickel steel. The levers and pedals are accessible and the amount movement required to render their ation effective, is well within that to be desirable by motorists of exence. The brakes are not "watered" because they are so designed as render this complication wholy unessary, and on the whole, it is not a idea to have water circulation, be e the chances of a freeze-up are immi, and loose water connections are not nown to motorists.

THE STEERING CONTROL.

e matter of steering is taken care no uncertain way. All the linkages the lever arms it is claimed are of me nickel steel, free from joints and ing and safeties are also provided. is steering gear is claimed to be a nct advance, to be absolutely irrever, and devoid of "lost motion," more it will not develop lost motion, even a long period of service. The gear em is also patented and consists essen y of a right and left double spiral, a thrust component, and a square cut set that takes the load, thus relieving spiral set of any of the shock or the sure.

e steering wheel is of steel with a ogany rim, and the wood is so fash d as to give the motorist a good grip. steering post is of chrome nickel , without brazing. The control sys mounted on the steering post enables motorist to operate the control mem , with either hand, without taking er hand from the steering wheel. it is possible to operate them with th fingers without taking the hand off th wheel. The control linkages are all en closed, but still very accessible.

THE CARBURETOR.

This most important device will not b described in any great detail, at this tim It is of the automatic variety operate on the float feed principle, and th gasoline nozzle is not adjustable. Hot ai

Fig. 4. Ellsworth Steel Bronze Flywhee flanged and with integral fan blades.

is supplied to provide the initial mixtur and cold air is automatically added t dilute the mixture in the right proportio as the speed of the motor accelerate Altho the carburetor is automatic it ca be manipulated at will.

THE SPRINGS.

The chassis springs are full elliptic rea and of the three-quarter type in fron They are of Krupp alloy steel, withou hinge joints, which is a new feature. is claimed they are "unbreakable" an that they provide an easy riding car.

"Sims-Bosch" magneto and a complet double system of ignition are used. Th water pump is of the "centrifugal" typ The oiling system is new and every bea ing is doubly provided for automaticall The oil pump is in the motor case an well protected, and is of substantial buil However, if anything ever does happe to it, the car will run just the same.

The gasoline tank is located in front o the rear axle, with fourteen inches groun clearance, and the gasoline is required t

French type bodies with divided front seat and straight panel behind. The tonneaus are extra wide, seating either three 300 pounds people, as the company states, or four people of ordinary size and the side doors are very wide and open to their full width. The seat fronts are polished, solid mahogany, and the upholstery is of the finest, buffed leather over curled hair and oil tempered steel springs. Pockets for goggles, maps, etc., are supplied in the step box on the right side the corresponding box on the left carries storage and reserve batteries. models are all built upon practically chassis, the general features of w have been but slightly changed over years' car. The equipment consists two side oil lamps, one rear oil lamp, large head lights, gas generator, h tube and a complete set of tools, inclu tire repair outfit, pump, etc. A partic

Fig. 1. 1908 Great Smith Car. The Chassis specifications of this machine are but sligh altered from last year's model. The engine has 4½ bore and 5-inch stroke; its French rat is 24 H. P., but it is claimed it develops actually 45 H. P. The body is of the French strai line type with the seat fronts of polished, solid mahogany. Suitable carrying pockets are s plied. The particular Smith features, such as the gear shift lever which automatically dis gages the clutch when moved for a gear shift and subsequently allows the clutch to enga the cone clutch type of rear hub brake; the special multiple disc clutch running in oil; elliptic springs, both front and rear; the removable top of the cylinder water jackets; the s cial Smith oiling device as described in previous models are all continued in the 1908 c Weight, 2,400 pounds. Price, $2,650 F. O. B. Topeka, including two side oil lamps, one rear lamp, two headlights, gas generator, horn, tube and complete set of tools, pump and tire rep outfit.

Fig. 2 1908 Great Smith Runabout. This car has very similar Chassis specifications to th of the touring car and is fitted with a runabout body as shown. With a standard equipment car sells for $2,650 F. O. B. Topeka. With rumble seat, the price is $2,740.

water jacket being removable for ning purposes. The bore is 4½ inches, ke 5 inches, the French rating being 24 P., but it is claimed the motor will lop 45 actual H. P. The crankshaft orged with the grain running around bends and is of high carbon, open th steel. All the bearings are extra e. The carburetor is a special float of Smith design. The three speeds ard and one reverse sliding change d gear is operated with one lever at right of the driver, which automatical- leases the clutch, shifts the gears and vs the clutch to reengage without use ny foot pedal. This device has now in use for several seasons and it is ned to have given perfect satisfaction. e clutch is of the multiple disc type runs in an oil bath. The special h worm and internal sector gear is

struction has been continually used for ten years and in no instance has it given any trouble; it saves about 100 pounds in weight over all steel construction and there is no trouble due to "fatigued" matter. The springs are 56-inch full-elliptic both front and rear, and the construction is such that no strain is put on them other than that of carrying the body. The front axles are high beamed steel drop forged; rear axles are tubular steel shell with special steel live axles upon roller bearings. The touring car weighs with full tank detachable rim and complete equipment 2400 pounds. The special "Stafford" cone clutch brake is used on the rear wheels. The brakes are operated by independent pedals, the hub brake pedal, which is lacking, first open the clutch and then applies the brake.

Two New Apperson 1908 Models

person Bros. Automobile Company, of omo, Indiana, announce that in addi- to continuing Model J. R., 50-55 H. P. krabbit" runabout, and Model K, 50-55 P. Touring Car, they are now placing the market two new cars, Model M., 35 H. P., four-cylinder, four passenger ster, and Model S, a six-cylinder, 50-55 . Touring Car.

for $2750. The regular equipment on the four passenger car includes a folding top and a three passenger body with the regulation chauffeur's seat, is optional. The entire car is built in the Apperson factory.

This new model has a four-cylinder water-cooled motor, with 4¾-inch bore and 5-inch stroke, rated at 30-35 H. P. The change speed gear is of the sliding selec

homas B. Jeffery & Company, Kenosha, consin, U. S. A., builders of the Ram- automobiles, will offer one practically car, the Rambler Model 34. In addi- the Rambler 31, which is a greatly roved Rambler 1907, Model 21, will narketed.

these two 1908 Ramblers, Model 34 be fitted with a tonneau body to seat passengers and a three-passenger bout body, while the Rambler Model vill be supplied either as a detachable eau body, five-passenger touring car as a two-passenger runabout.

he general policy of moderately priced uction adapted to meet the require- ts of the middle classes of motor car hasers, which has carried the Jeffery blishment well to the front among the mobile makers of the world, will be

ascertaining and recording the work don in the car-motor cylinder thruout its cycl of changes, and placed this most complet motor-testing plant in charge of a full competent investigator, so that the entir performance of the Rambler motors i now fully known to its engineering force

The Rambler orders for materials to b used in 1908 are not yet wholly placed but the production will be about 3000 car of somewhat more costly forms than i 1907, and the aggregate materials cos will be greater for 1908 than it was i 1907.

The Model 34 is a five-passenger tourin car with 112 inches wheel base; 56 gag and 36 by 4-inch tires. The four-cylinde vertical, water-cooled, four-cycle motor i 4½ by 4½ inches, with a nominal horse power of 32. The change speeds are b

Fig. 1. The Rambler 1908 Model 34, five-passenger touring car, wheel base 112 inches, e 56 inches, tires all 36x4 inches. Motor four, water-cooled, four-cycle, 4½x4½ inches, cylin- s, nominal 32 H. P., selective sliding gear, three forward speeds and a reverse. Tonneau y, side doors swinging to the front, to seat five pasengers. Weight 2700 pounds, tanks filled. e $2250, including five lamps, gas-tank, mats, horn and tools, all ready for extended touring. e-top extra.

inued, the four-cylinder, five-pas- er touring car being listed at $2250, the four-cylinder runabout the same, e the 1908 Model 31 is placed at $1300 two-passenger runabout and at $1400 n fitted with the detachable tonneau arry five-passengers.

THE RAMBLER FACTORY.

e original Rambler factory had 70,000 re feet of workshop floor space which been increased every year since that e first sale, 1902, until it now covers 00 square feet.

e additions have been principally of tooth roofed structures with concrete s and floors, skylighted, which form y one of the largest motor car fac- s in the world.

selective sliding gear, three forwar speeds and a reverse. The car weigh 2700 pounds with full tanks, and sells fo $2250, including five lamps, gas-tank, mats horn and tool. Tops are extra.

The three-passenger roadster weigh about 2350 pounds and sells for $2250. I is on the Model 34 chassis. The Mode 31 has a detachable tonneau and wil carry five. Its wheel base is 106 inches gage 56 and the tires are 34 by 4 inches The motor as in last year's model is a opposed pair of cylinders set lengthwis of the car under the body. The bore i 5 inches and the stroke 6 inches, th nominal horse-power being 20. A plane tary speed change gear and chain driv to a divided rear axle are used. The ca

n each chassis, making a line of only four ars as contrasted with seven different ehicles in 1907. This great reduction n the numbers of different models and he consequent lessening of the number f different pieces demanded from the actory, gives much greater factory pro-ucing capacity with much more time vailable for the consideration and bet-erment of each detail required, and can-ot fail to both lessen the first cost and nprove the quality of the 1908 cars.

The 4½x4½ bore and stroke is re-ained in the four-cylinder motor of Model 4, but the overhead valve placing and eam valve-action have been changed to oth valves on one side of the cylinders, ith direct valve-action from one cam-

The aluminum crank-box and oil and the grey iron crank-box and sepa grey iron oil pan, both used in the Rambler motors, have been discarded favor of a new, one-piece, grey-iron, c bined motor-base and oil-pan for the gle model of four-cylinder Rambler motor. This grey-iron, integral crank and oil-pan is made with the whole r side open and is a very great impr ment. It is not out of place to note that notwithstanding this change f aluminum to grey iron in the motor b the Model 34 chassis is about 100 pou less weight than the 1907 chassis, u the same bore and stroke motor.

The Rambler Models 21 and 27, 1 showed a new opposed cylinder motor sembly, which boldly enclosed the

Fig. 2. The Rambler 1908, three-passenger roadster, same Model 34 chassis, to seat th passengers, weight 2350 pounds. Price $2250, including five lamps, mats, horn, tools and tank, ready for the road.

haft. The crank shaft has been enlarged rom 1¾ inches to 2 inches diameter, with n increase in the length of the bearings. he port diameter is carried over un-hanged 1⅝ inches for both intake and xhaust.

The unit propulsion assembly first dopted by the Rambler in 1907 has been nproved by making the sliding gear hange selective, and the side-shaft as ell as the line-shaft is placed on Tim-en rollers. The prest steel brake-drums ave been increased from 10 to 13 inches iameter. The internal brake-shoes are f grey iron, and the external brake-band camel's-hair-felt faced. The bevel gear nd the twelve-pinion spur balance gear ave satisfaction in 1907 and are retained 1908. The spark and throttle control, rmerly had by a tilting ring placed un-er the steering wheel in all previous ars, is obtained by ratchet-retained levers

wheel, clutch and planetary change in a large cylindrical cast alumi housing, fully protecting the plane brake-bands and the clutch from dust road drift, and giving this simple low-cost driving assembly a durab never before attained. For 1908 this s general scheme of assembled-unit, posed-cylinders, propulsion assembly been retained with a larger fly-wh giving a powerful, compact, well ported and perfectly protected const tion.

The ratios of the planetary change have been somewhat changed, the pl tary brake-drum diameters have been creased, and the disc-clutch lubrication been made certain by taking an oil to the inside of the annular friction di The planetary speed changes are all tained by a spring pawl which automati ly engages a notched segment at e

hes diameter, walls ¼-inch thick, dropt nches in the middle, steel drop-forged ing pads, pinned and brazed in place. stub-axle yokes are steel drop forgings, ced on the tube and pinned and brazed. e stub-axle pin is one inch diameter, dened and ground and is in hardened el bushes. The load is carried on a k ball-bearing. The front wheels are two circles of balls having two point rings. The rear axle is made up in a d assembly with the propeller shaft ing and the change gear-box, with one versal-joint only, at the front end of integral line-shaft, propeller shaft and el-pinion shaft. This single shaft which es the place of three shafts commonly ced between the crank-shaft and bevel r, is squared thru the gear-box, is ered for the bevel pinion seat, and is

sleeves. The spring pads and the brak drum-covers are in one integral malleab casting, split and pinched on the axle tu by two large screws.

The brake drums, prest steel, are inches diameter by 2½ inches face, inches larger diameter and ½-inch mo face than in 1907. The internal shoes a grey-iron castings, jointed and cam-rock expanded. The exterior brake-band is fib lined and three-hole lever applied. Bo exterior and interior brakes are appli thru eveners.

THE FRAME AND SPRINGS.

The frame is of prest steel. The greate frame side depth is 4⅛ inches, width 1 inches. It is 34 inches in the rear and inches in the front. The material is hi carbon steel, 5-32-inch thick.

The springs are all half-elliptics, 2 inch

Fig. 3. Rambler 1908, five-passenger detachable tonneau body, Model 31, wheel base, 10 ches, gage 56 inches. Tires 34x4 inches. Motor an opposed pair of cylinders set lengthwis the car, four-cycle, water-cooled, 5x6 inches, nominal 20 H. P. Planetary change gear, tw rward speeds and a reverse, chain to divided rear axles. Weight 2100 pounds, price $1400, in uding five lamps, gas-tank, mats, horn and tools.

one roller bearing at the front end of gear-box, one Timken roller bearing at rear end of the gear-box and one Tim- bearing at the forward end of the el pinion with a plain babbitt bearing the bevel gear housing at the inside of the bevel pinion, four bearings in for this one shaft.

The side-shaft is placed below the line- ft, and is on Timken rollers at each . The gear-box is an integral aluminum ly and rear end, with an applied grey n front head, the front end opening ng enough to permit assembling. The r drive from the line-shaft to the side- ft is thru coiled spring cushions. The

wide in front and 2½ inches wide in t rear, ribbed and banded. The front spri is jointed to the chassis frame in fro and linked at the rear. The rear spring linked to the frame at both ends. Scre adjusted struts are fitted. The propulsi shaft casing and gear housing resist t torsion.

THE MOTOR.

The four-cylinders, 4½x4½ inches a offset 1⅛ inches, ¼ of the stroke. The tegral, grey-iron crank-box has the re end and the top seat for the middle beari box applied. The lower halves of all thr crank-bearing boxes are babbitted in plac the top half of each box is rectangular o

'he motor has a 3-point support, on a shaft past thru the crank-box in front, and in th
ear the crank-box is journaled in a bearing on the chassis-frame cross-girt.

THE CLUTCH.

The clutch is a reversed cone, leather ced, between two coiled springs, the ger and stronger on the inside, to press e cone to the rear into engagement, and e other coiled spring is placed between e disengaging sleeve and the cone hub. e disengaging action first closes the ex- ior spring on itself and then pushes the ne forward against the internal stronger ring to effect the disengagement. So far e outer coiled spring has no functional ect, but when engagement begins by ease of the exterior spring compression, e cone is between two coiled springs opposed to each other, and this causes "gradual" engagement, altho the clut leather is fixt directly to the cone fa This gives a very flexible slipping enga ment which permits starting the car high gear when the road surface is fa This arrangement is new to the writer a seems to be a real improvement. T universal joint from the clutch hub to t line-shaft is a short, double-ended "w bler," all hardened working surfaces. T thrust of the driving wheels is thru t struts to the chassis frame.

THE MODEL 31 CHASSIS.

The front axle is the same gene

Fig. 3. Jackson 1908 Model E, Front axle, oblique underneath view of chassis. All working parts are encased, making the large, thin, frail, sheet-metal dust-pan needless. The carburetor only is surrounded by a sheet metal casing, which is small and strong. The machinery of this Jackson Model E is all enclosed in substantial steel tubes or castings, and the casings are made to serve as framing. This illustration shows the ½-inch diameter cross-rod, which supports the front end of the motor in journals.

s the selective, three speed forward and reverse sliding-gear, and placing this entire motive assembly on a three-point support. The unit driving-assembly of 1907 is retained in model D, with a single universal-joint at the forward end of the propeller-shaft, but the 1907 half-elliptic springs are replaced by full elliptics, fixt to the chassis-frame brackets on top and resolutely mounted on the rear-axle sleeves below, screw adjusted flat-jointed struts being introduced between the rear-axle sleeves and chassis-frame. The rear full-elliptics greatly improve the riding of this car.

The 1907 Jackson model C. an opposed pair of cylinders set lengthwise under the body with chain to the divided rear-axles, proved to be a very speedy and satisfactory low-price car, and save for a slight change in the control is carried over for 1908, substantially as offered in 1907.

A separate new motor plant, established about a year since, now produces all the Jackson motors, besides giving a chassis assembling room on its second floor. The new 4 cylinder Jackson 1908 model E motor

building, 234-220 feet, ha 100,000 square feet of floor face, to which the Jackson tory will be removed al January 1st, 1908. This building is well lighted and connection with the motor tory, 50x200 feet, 2 sto which will be continued, an new drop forging plant, al 50x150 feet, first worked March, 1907, will give rapidly growing concern r enough for filling its orders.

At the date of this wri none of the Jackson 1908 m bodies are finished, and th lustrations here given show complete cars. The new J son bodies are all straight effects, bringing all the Jackson car bodies into c parative harmony of outlin

In Fig. 1 is shown the J son 1908 Model E, four-cylin chassis, right side elevation. The wh base is 111 inches, gage 56 inches, and tires 34x3½ inches. The motor is 4 cylin 4½x4¾ inches, 4-cycle and water-cooled

out the same as the 1907 model E original design and construction of the

pening in the front-board. The cam-shaft s driven by a vertical shaft in front, with wo pairs of bevel gears, gears all encased. The valves are 2 inches in diameter, inlined, and have integral stems. They are

Fig. 11. Jackson 1908 Model D, Plan of opposed motor under the hood. Note the long levers which work the valves, and the boxes on top of the chassis-frame sides which support the front end of the motive assembly.

teel forgings, all alike. The motor-base and oil-basin are of aluminum, with individual oil-pits for each connecting-rod; he oil-pits have small connecting oil holes, with a force-feed oil lead to each of the 4-cylinders; the crank pits are supplied rom the cylinder oiling.

The rods are steel drop forgings, bronze-oushed on top, capt on the crank-wrists. bored and fitted with flanged half-boxes of best babbitt, the boxes being finished all over. Five aluminum-casting members go o make up the motor-base, oil-basin, flywheel, clutch-casing and gear-box, all five pieces being bolted together forming a rigid frame-work assembly, 3-point supported. The 3-point support is by journaling the rear end of the gear-box in a bearing bolted to a chassis frame dropt cross-girt. A bored hole, S, crosswise thru the motor base, takes a 1½-inch diameter steel shaft, having its outer ends supported in bearings fixt in the chassis frame-side channels. The oiling is by a force-feed oiler, with leads to each cylinder and to the various bearings as needed.

BRAKES.

brake-bands are Gandy belting-lined a hole lever applied.

The bevel gears are all special steel oil-tempered. The reduction ratios 4 to 1, and 3 to 1. The solid-stud ch are 1-inch pitch. The small sprockets special steel, oil tempered.

Jump-spark ignition from storage tery current-supply for models D an and dry cells for model C, is used.

CONTROL.

This is the same for models D an and is a worn and trunion nut, trun in boxes sliding in the top slotted a of the globe-end steering bell-crank. model C, the steering is by a hard worm and sector, centers adjustabl eccentric steering-shaft-bushes, screw tained. D and E have the same spark throttle control, two levers, ratch tained on top of the steering wheel. C the spark and throttle control ar an exterior sleeve with a concentric shaft, parallel to the steering post, ha ratchet-retained levers fixt to the sl and rocker upper ends, and located in rear of the steering-post, under the h wheel. In models D and E two ou hand-levers are used, the inside on latched, and when pulled backward

the selective change gear. No accelerator pedal is fitted to any of the models. D and E have plunger pedals for opening the muffler, and two large upright pedals of which that at the left disengages the clutch only, while that at the right applies the external ordinary brake only. Model C has one outside lever, latched, which is pushed to forward extreme for high speed, pulled to the rear to mid-position for neutral and to extreme rear for low-speed. There are 3 upright pedals on the footboard. The left pedal is pushed forward for the reverse only. The middle pedal is pushed forward to obtain low forward-speed. The right pedal applies the rear-hub brakes only, and a fourth upright pedal, smaller than the others and placed at the extreme left, opens the muffler.

ON THE ROAD.

Thursday, October 10, a Jackson 1908 4-cylinder model E touring car left the Otsego Hotel, Jackson, at 8.00 A. M., two tonneau passengers, Robert Burman driving and the writer, front seat passenger and was driven first over very bad, sandy roads to Charlotte, 37 miles, and then 20 miles to Lansing, over roads good in some places, but deep sand much of the way, with the driver and writer only, the tonneau passenger returning from Charlotte to Jackson by rail. Friday morning, October 11, the car left Lansing, at 8.00 o'clock, and was driven over rough roads with plenty of sand, to Jackson, 40 miles, at 9.50 o'clock.

This model E was so new that it had been driven only 5 or 6 miles before this run, and had no lamps, no oiler and no mud-guards. One thing it did have that no one suspected, was a front axle set half an inch farther forward on one side of the chassis frame than on the other side, making one front wheel stand nearly an inch ahead of the other, an assembler's blunder, which did not much affect the steering on hard road surfaces, but made things very queer indeed in deep sand, so that from Jackson to Charlotte, over one of the worst loose sand roads the writer ever encountered, it was a case of drive every instant for Burman, with the model E off the road first on one side and then on the other, doing something wholly unexpected every minute, sometimes holding the road all right and then steering to one side or the other just because it took the notion, and crossing the road several times before it could be induced to take the wheel tracks again. The sand was very deep, and the ruts were narrow enough to pinch the tires and the hind wheels naturally tried to go ahead of the front ones, as is always the case in very heavy going, and in this run the front axle misplacing and the deep sand together put the car out of control to an extent which was sometimes really alarming.

As we had no oiler and the motor was new, we kept a good deep oil-pool in the crank-box, and left a smoke trail like that of a locomotive behind us. This new Jackson 4-cylinder engine is very strong on low speed, and is almost silent and ran to perfection all the time, giving plenty of power, making the car a very speedy hill climber. All this part of Michigan is very hilly, with crooked, sandy roads, so that the heavy going and wild steering gave a very severe test, both of power and sound construction. At Charlotte we found what was the matter with the steering and so were less apprehensive thereafter, tho the car continued to make unexpected shoots and slants when pushed in deep sand.

The road from Lansing to Jackson was fair for a good part of the way, tho sandy in spots and not really good anywhere, and we made the 40 miles in about 90 minutes running time, as we had one long stop to educate two horses led by two passengers in a buggy drawn by a third horse.

This 100-mile run of the new model E showed everything to great advantage, and gave a much more convincing demonstration of power, silence and strength of construction, than if the roads had been good and the steering perfect. The Jackson 1908 model E is very still, has excellent springs and can tour American roads all right, no matter how rough or hilly or sandy they are.

The new home of the Matheson car, a handsome concrete and steel five-story and basement building, located in New York City, between Forty-ninth and Fiftieth streets, and running from Broadway right through to Seventh avenue, will soon be ready for occupancy. The upper floor has been arranged as a repair and stock room; three intermediate floors will be used for the garage, and are capable of accommodating 150 cars; a magnificent salesroom, 36-40 feet, with a mezzanine balcony and offices, will be located on the main floor. The building is provided with two large elevators, each having a lifting capacity of 12,000 pounds.

horse-power, and selling at $3500. Known as Type XV, it follows very closely the construction details and appearance of the Type XII, of 1907. The cylinders, however, are a trifle larger than last year, and several refinements suggested by the experiences with this car have been adopted.

The cylinders are four vertical, cast in pairs and having the valves in the head on opposite sides with the cylinder walls, heads and valve chambers integral. The cylinders measure 4⅞ by 5¼ inches.

jacket and that for the rear pair is short 1-inch pipe connecting the adj faces of the castings. The return fl by a pipe from the top of the jacke the radiator top. This piping is of ble diameter, that portion leading fro rear cylinders being 2 inches, but in ing to 2½ inches where it is joined b branch from the two forward cylinde belt driven cooling fan is employed.

THE CARBURETOR.

The carburetor which has been use

The 1908 Gaeth Type XV Touring Car, four-cylinders, 4⅞ by 5¼ inches, rated at 35 H Make and break spark ignition is used. The wheel base is 112 inches; tires 34 by 4 inc weight approximately 2700 pounds; price, $3500.

The Gaeth method of grinding piston rings and cylinders which has been used for several years is continued. In this the piston rings are secured in the piston grooves by an adhesive, and are held rigidly in place thruout the grinding process. When the adhesive is dissolved the rings are already in position without the necessity of springing them into the grooves.

Metal to metal gears are used on the cam shaft, and they are placed inside of the cam shaft chamber and run in oil, thus eliminating noise. A special jig has been rigged for grinding the cam shaft gears in place and mating them. At the end of the cam shaft there is an adjustable bearing by means of which the gears are adjustable to wear.

The thermo-syphon system of cooling cylinders, which has been found very satisfactory in many long hard runs, has been

cessfully for several years, is now placed on the open market by a Clev concern. It has a three fold control. air entering from below, the entering line and the mixture passing to the r are all controlled simultaneously fro lever at the top of the steering w The carburetor is of the separate chamber style, and its mixing chamb a vertical cylindrical space fitted w rotable needle valve. This has i base two radial V-shaped opening regulating the air entrance. In its there is a circular opening for contr the exit of the mixture. A part revo of this throttle also effects a part ment of the needle valve in the nozz that with a larger entrance there greater flow of gasoline. No auxilia valve is used, and it is possible to s gasoline valve for a low running poin go up to highest speed without fu

CHARACTERISTIC FEATURES.

ng of 25 gallon gasoline tank at the of the car; and lockers under front s, all being points which have become dard in foreign cars, and which Amer- manufacturers will eventually have adopt. The exclusive features are: powerful independent brakes, which operated in unison or separately, at one a 10-inch drum with 2-inch face he line shaft back of the transmission ated by foot pedal; a second small e on the line shaft in front of the smission used in connection with the ch; a regular foot brake with a 12- brake band, and 2-inch face; and an rgency brake, which is 2-inch face on -inch brake drum, which is camel's against steel. These brakes are ex- ely powerful, and easy to operate.

THE CLUTCH.

the fly wheel is carried an ingenious powerful clutch, consisting of five s or disks, two of which are phosphor- ze, and the other alternating three of steel. There is no jerk in starting car, and absolutely no chance of the ch releasing except at the will of the ator. There is a heavy coil spring, h throws the clutch in, but is not de- ed upon to hold the same in position, function being performed by bell k levers.

he change speed gear gives three ds forward and one reverse, direct on . Compactness, strength and acces- ity are characteriistics to be noted in transmission, which is enclosed in an inum housing, and fitted with Hess- ht ball bearings. The shaft is of ial chrome nickel steel. Change of is accomplished by side lever in an ot quadrant, in which the emergency e lever also operates.

IGNITION.

nition in all cars is by jump spark storage battery and dry set in re- e, and Lacoste vibrating coil with le throw switch. The company ngly urges all its customers to ify, however, in addition, their special neto, which is used in connection with other system—their double throw ch, before mentioned, and a specially gned distributor—making two inde- ent ignition systems. This latter out- s guaranteed for three years, ab- tely free from annoyance and repairs, to give uniform and continuous opera- all that is required is an occasional g. This outfit lists at $150 extra. system, it is claimed, provides per-

or oil. All working parts are packed grease for a season's running, and 20 pe cent. efficiency is guaranteed over othe systems. The company claims it is a easy to start the motor on the magnet as on the storage battery. With the spe cial compression relief with which th motors are provided it is very easy t spin the motor. The alternating curren of high frequency which is fed directl to the primary coil is the secret of th success of this system. In the coil th inductive effect or magnetic reversals ar

The Ford Line

for 1908

AS PER USUAL—will eclipse everything else.

AGENTS ARE ANXIOUS to learn what it is to be—so are our copyist competitors, and we are not telling.

ALL THE PRESENT MODELS will be retained—every one is a world-beater in its class—not one, has a rival to-day; nothing others can bring out in 1908 can possibly compete in quality and price.

THE FORD SIX—the car that made the fame of sixes and compelled 27 unwilling makers to follow its lead, will still be made in the two types—the 40 horse power touring car and the "6-40" Gentlemen's roadster. Finish a trifle better, and price a trifle higher perhaps, but otherwise the same as '07.

MODELS "N & S" RUNABOUTS cannot be improved upon. Both are now standard products.

THERE'LL BE ONE new runabout—a light roadster that will show the way to everything else on wheels, quality, price, performance and appearance beyond compare.

TWO OTHER SURPRISES—yes, a light touring car is one of them—that will be the delight of prospective buyers, the despair of competition.

SEE THEM ALL AT THE A. C. A. SHOW: You'll say "the world is Ford's for 1908."

Fig. 5. The New Oldsmobile Model X, Touring Car. Wheel base 106 inches, gage 56. The motor 4-cylinder, vertical 4½x4¾ inches, four cycle water-cooled, rated at 30 H. P. Selective sliding r and bevel gear shaft drive is used. The car seats five, weighs 2250 pounds and sells for 00, including 3 lamps, mats, horn and tools.

weight is 2250 pounds, and the price 900, including 3 lamps, mats, horn and . The acetylene lamps and cape top extra.

1907 the Oldsmobile line was a single inder chassis, fitted with either a ing or a roadster body, and a single ider runabout. For 1908 the single ider chassis is finally abandoned, and el Z, a six-cylinder, and Model M, a 4-cylinder, and Model X, a new 1908 4-cylinder model constitute the Oldsile line. With the different bodies gives the Oldsmobile 6 models of cars 1908, a landulet and a limousine body g placed on the Model M chassis.

ese changes are significant, first, be- e the abandonment of the single cylin- runabout, which was once the leading ess in point of numbers sold, marks end of the usefulness of the single- ider type of motor car so far as the mobile determination of values is con- ed; second, because the number of rent models offered by this company 908 is six, as against three for 1907. also noteworthy that a new, high- ed six-cylinder car heads the 1908 mobile list, and that this 1908 line with a new light 4-cylinder car.

NOTABLE FEATURES.

to important structural changes the mobile 1907 practice included half- tic springs only, while the 1908 els Z and M, 6-cylinder and 4-cylinder ectively, are fitted with full elliptic gs in the rear. The cone clutch is d in all Oldsmobile 1908 cars, all use sliding-gear, and all are bevel-gear n.

to details, the 6-cylinder motor has crank-shaft and cam-shaft in Hess- t ball bearings. All front wheels are

are combined with annular ball bearing in Model Z. The Hyatt roller bearin which was first introduced as a motor ca component in Oldsmobile cars, is no wholly abandoned in their construction.

Fig. 6. Oldsmobile 1908 new carburetor. It asserted that the forms of the throat and stand pipe and the area and spring of auxiliary ai valve have been so perfectly proportioned tha the carburetor here shown gives a perfectly satis factory mixture at all motor speeds. It will b noted, however, that both the auxiliary valv spring compression and the needle valve positio are screw regulated, with cluck-nut retention.

Model Z is fitted with both magneto an storage battery current supply, with tw

Announcement

For 1908 We Shall Have Four Distinctly GOOD Automobiles

1. The Model C Jackson, listing at $1250, a chain drive, two-cylinder touring car, 20-24 H. P.
2. The Model D Jackson, listing at $1500; a bevel-gear drive, two-cylinder touring car, 20-24 H. P.
3. The model E Jackson, listing at $2000; a bevel-gear drive, four-cylinder touring car, 35-40 H. P.
4. The Model E Jackson Runabout, listing at $2000; a bevel-gear drive, four-cylinder runabout, with rumble seat, 35 40 H P.

The Model C has a planetary transmission, the others have sliding gears, selective type; all have full elliptic springs, rear; every one of them is distinctively a leader in its class; all of them will certainly sustain the well-known reputation of Jackson cars for style, speed, power, and endurance.

it would certainly be a serious mis- to do otherwise than follow the old- ioned advice "let well enough alone." hree distinct models of different power mechanical features are offered, els A, S and H. Model A is a 35 H. P. -cylinder car, the motor having 4½- bore and 5-inch stroke, cylinders cast airs with integral water jackets, three d and reverse sliding change speed , countershaft idle on direct 110-inch

18 H. P. The motor is 5-inch bore by inch stroke, and is located lengthwise u der the body, and drives by a two spee and reverse planetary, to a single cent chain. The wheel base is 92 inches, th body is large and will accommodate fi passengers. The same arrangement springs as on the other models is use The car is fitted with the same contro brakes and equipment, and sells for $125

On the four-cylinder models there are

1908 Moline 35 H. P. Model "A;" motor, four cylinders vertical, cylinders cast in pairs, -inch bore, 5-inch stroke, three speed and reverse, sliding gear; countershaft idle on direct ve; wheel base, 110 inches; tires, 34x4 inches; 40-inch cross semi-elliptic front spring and inch full elliptical springs at the rear, with scroll ends. The Moline sliding hood has been continued, and a folding hood of the usual type substituted in connection with a brass finished ular radiator. The equipment consists of two large acetylene gas lamps with generator, two are side oil lamps and one tail lamp, tool kit in canvas roll with oil gun and wheel puller; tire repair outfit and pump. Price, $2500.

el base, 34 by 4-inch tires, double es on the rear wheels, 40-inch cross -elliptic spring at the front, and at rear, two 42-inch full elliptics with ll ends. The car is shaft driven and ion is by jump spark. The price with equipment of two large acetylene gas s with generator, two square side oil s, one oil tail lamp, tool kit in can- roll with oil gun and wheel puller, tire ir outfit and pump, is $2500.

odel "S" has almost identically the e lines and general appearance as the er model, but is equipt with a four- nder water-cooled motor of 3⅞ by 4½ es, rated as 24 H. P., and the wheel is 100 inches, tires are 32 by 3½, and change speed gear is similar to model

few changes in the general appearanc most noticeable of which is the new hoo and radiator. For several years Moline car have had a distinguishing feature in th hood and radiator, which was after a de sign entirely original. It was so arrange that it would slide forward to uncover th motor. The construction was such tha the radiator was covered entirely by th hood, instead of standing out in front o it. For 1908 this well-known sliding hoo has been discontinued and the foldin type of hood substituted in its place. Thi construction requires the use of a differen style of radiator, which is finished in brass and stands outside the hood in front.

Another change in the four-cylinder car for 1908, which makes them decidedly mor

THE CLEVELAND MOTOR CAR CO.

e body, and as a whole they effect a decided improvement in the general ırance.

addition to the changes in the general ior appearance of the four-cylinder there are numerous changes of small ls in the construction of the motors. e are of a nature that might seem in- ficant were they to be enumerated in out the result is that the motors show power, and are very much more quiet smooth running.

e two-cylinder car for 1908 is con- d in exactly the same style, and at ame price as offered for 1907. The ss of this car has been phenomenal the start. It is exceedingly well after a design that has been proven ct. The company claims this car has e power for the weight, exceptionally riding springs, and positively the somset body in the two-cylinder field e present time.

The 1908 Iroquois Cars

e Iroquois Motor Vehicle Co., of ca Falls, N. Y., offer for 1908 two cylinder models, known as Types D C.

e larger model, D, has a four-cylinder cal water-cooled motor with cylinders in pairs, bore 5-inch and stroke 5- rated at 45 H. P. at 1200 r. p. m. The inside the engine are all held by channel steel. The front springs are full elliptic and the rear, platform. The body is King of Belgium type. The equipment consists of two side oil lamps, one rear oil lamp, two headlights, one generator, clock, French horn and full set of tools. The car sells with this equipment for $3000.

The 30 H. P. type C car, is fitted with a removable tonneau and a chauffeur's seat as shown in the accompanying illustration, is furnished and can be quickly attacht. The general arrangement and construction is the same as in the larger car, but the motor is 4½, instead of 5 inches bore, with the same stroke of 5 inches as the other model. This car has 32 by 4-inch tires, instead of 34 by 4-inch. The speed ratio is 3½ to 1, while on the larger car it is 3 to 1. The equipment is the same as the other model.

The New Pope-Waverly Models

The Pope Motor Car Company, of Indianapolis, Ind., has just brought out two new electric models, namely, 70-C a Victoria Phaeton with removable coupe top and model 71 Runabout.

Balance, trimness and proportion are the distinguishing features of Model 71. The old style box pattern body has been done away with. The battery is so distributed and the slight projection in front of the dash is so proportioned to that in

"Iroquois" type "C," 30 H. P. furnished with a detachable King of Belgium ton-, and a rumble seat to take its place as shown. Both cars are light weight air-coole machines of the runabout type, the me chanism of which was described in ou November, 1906 issue, page 136. Mode 6 is a two-passenger car, while model herewith shown is provided with a rumbl seat. Light weight, a four-cylinder ai cooled engine and a patented rear axl transmission direct on all speeds are th important features.

Digitized by Google

Ohio, for the season of 1908 are higher powered, larger and roomier, but are characterized by few changes as compared with previous models, the principal changes being: a larger wheel base, seven-passenger body, location of front axle further front, 36-inch wheels, flat springs and a double ignition system, including a magneto. A new 6-cylinder model has also been added. Three standard models will be marketed, Models 18, 15 and 20. The model 15 for 1908 will be precisely the same as the 1907 model 15. This seven-passenger car is rated as 45 horse-power. The motor has four cylinders cast in pairs with cylinder dimensions of 5½x5¾ inches. The wheel base is 119 inches, and the same double ignition system used on model 18 will be supplied.

easier and more certain removal of sand. The cylinders are cast in pairs offset intake and exhaust valves on o site sides. The water-jacket plates ar made in copper instead of aluminum. cylinders are carefully bored, reamed ground, then lapped out with a spe polishing preparation with piston rings in place.

CRANK CASE.

The crank case proper is a single al num casting, designed for strength non-leakage of oil. Easy access to necting rods and bearings is provided the bottom of the crank case by m of hand-hole plates. These plates fitted with a deep recess or groove, which the dirt and sediment from the deposits. By the removal of a plug i

Fig. 1. Model 18 Peerless 30 H. P., seven-passenger touring car. Wheel base, 118 inch front axle further forward than last year; 36-inch wheels, flat springs and a double ignition s tem, including a magneto. A new six-cylinder model will also be marketed. For descript see text.

It is furnished with a limousine body which is interchangeable with the standard touring body or with a roadster body which is not interchangeable, and which does not fit on the chassis used for the touring car. Thirty-six inch wheels, artillery type, with dished spokes are used, and are equipt with four-inch tires on the front wheels and 4½-inch on the rear.

Model 18 is a 4-cylinder, 30 H. P. car, the cylinders being 4⅞x5½ inches. The wheel base is 118 inches. The model 20 is an entirely new 6-cylinder creation for seven passengers. The cylinder dimensions are 4⅞x5½, and the A. L. A. M. rating gives 57 H. P. This car is fitted either as a touring car or a roadster, and sells for $6000. The same general construction will be used as on the other models. The wheel base is 133 inches and tread stand-

either end of this groove the sediment dirty oil may be withdrawn, without removal of the sod pan, so that it is to keep the motor well lubricated clean oil.

THE CRANK SHAFT.

The crank shaft is a solid drop forg specially treated, hardened and gro accurately to size. The front bearin fitted with a stuffing-box to prevent l age of oil. All gears, including half-t pump and magneto gears, are housed compartment in front of the motor run in oil. This not only minimizes w but prevents noise.

Both intake and exhaust valves are seated, mechanically operated and i changeable. Made of a special alloy ported valve steel, the same as they l used for the past two years, and adj

governor maintains any desired rate
otor speed, practically irrespective of
oad or grade.

IGNITION.

e ignition system includes the same
commutator and a single battery, as
on the 1907 cars. In addition to this,
entirely separate, is the Eisemann
ch type, low-tension magneto. All
s are connected with their terminals
spring attachment, so that there are
umb nuts to release. The wires can
etached and the magneto entirely re-

from the half-time gears, and no belts or pulleys are used.

Radiator has been set back five inches and is now directly over the front axle and the same design will be used on the model 18.

CLUTCH AND CHANGE SPEED GEAR.

An internal expanding clutch which engages smoothly and is very light in weight is used. It is easily adjusted to compensate for wear, the only tool necessary being a screwdriver or a pair of pliers. The clutch can be taken out complete, without removal of sod pan or disturbing either motor or transmission, as a short removable shaft with two universal joints connects the clutch with the transmission.

Fig. 2. Model 18 Peerless 30 H. P. motor, exhaust side, showing the complete housing of parts, the fan pedestal, location and driving of the water pump. Note the governor between front gears and the pump.

me loosened. All driving parts of the axle have been increased in dimen- and are now made from imported nanganese steel stock, which the

REAR AXLE CONSTRUCTION.

A live axle shaft operates in a 2½-inch tube, which supports the weight of the car. The bevel and differential gears are situated in the center of the axle, and housed in a grease packed cast steel casing. On each side of the driving gears and connecting with the live axle are universal joints, which take up all strain on the axle and prevent any binding of the gears. These universal joints in the live axle make a strong arched construction possible, and also permit dishing the rear wheels two degrees, the same as the front wheels. The wheels are carried on the stationary axle tubes on imported ball bearings of extra large size. The main bearing for the pinion gear is of extra large size, and is easily taken out with the pinion complete.

Distance rods which take the driving stresses run from the frame to rear axle on either side and are adjustable by means of a turn-buckle, and a torque rod is used from the differential casing to a spring bracket, attached to a cross member of the frame.

The front axle is a solid one-piece drop forging of I-beam section, the spring saddles being forged integral with the axle. The center of the front axle is the lowest part of the car. The steering knuckles in the axle yokes are fitted with special imported ball-bearings of large size and an improved oiling arrangement.

justable bearings of imported design ⅜-inch balls are placed above and the sector. Two sets of brakes are to the rear wheels. The internal es are 12½ inches in diameter of ze, and the external contracting band es are 13 inches in diameter of l's hair belting. The internal bands 2½-inch face.

THE FRAME.

e drop trussed frame of cold rolled will be continued in use on all 1908 ls. This feature was first used on l 15 of 1906. The dropping amounts o and one-half inches, just in front e rear axle, which carries the center avity of the car and load nearer the d, without interfering with the road ance and brings the whole driving anism in alignment.

tonneau longer and more spacious than last year. The standard body is built to carry seven people comfortably. Small seats of folding type are used, which are practical and comfortable. These may be folded against the side when not required for use and are easily removable when it is desired to use the car for five passengers only.

The standard color will be maroon with light red running gear, altho other color combinations will be furnished when ordered.

MODEL 18.

Frame—Length of frame over all, 155½ in.; length of sub-frame, 79⅜ in.; length back of dash to end of side channel, 100 in.; length forward to dash to end of side channel, 35½ in.; height from ground to top of frame, 25 in.; thickness of frame

Fig. 5. Model 18 Peerless Rear Axle and Differential. On each side of the differential ected to the driving shafts are universal joints, which prevent any binding and allow an ed rear axle housing, which is very strong, and also the dishing of the rear wheels two de- s, the same as the front wheels. Imported annular ball bearings of large size are used; pinion gear and its large bearing are arranged to be removed together. The axle is further gthened by a turnbuckled truss rod.

e springs are made by Lemoine of ce of silico-manganese steel. Both front and rear platform springs are r and flatter than those used on the models. The front are 40 inches by hes wide, the side rear springs are inches by 2¼ inches, and the rear spring is 38½ inches by 2¼ inches. prings are banded and the spring eyes ushed and fitted with oil cups.

irty-six inch wheels, artillery type, dished spokes, are used, both front rear. Four-inch clincher tires are on the front wheels and four and one-inch on the rear, and the fender de-

steel, 8 U. S. S. Gauge, 11-64 in.; depth of side channel, 4½ in.; wheel base, 118 in.; clearance flywheel, 10 in.

Motor—Number of cylinders, 4; bore, 4⅞ in.; stroke, 5½ in.; valve action, mechanical; number piston rings, 4; order of firing, 1, 2, 4, 3; type of clutch, internal expanding ring; width of leather on clutch face, 3 in.; diameter of clutch drum on flywheel, 12 in.

Brakes—Number of brakes, four—2 external—2 internal; diameter of internal brake band, 12½ in. bronze; diameter of external brake band, 13 in. camel's hair; width of face internal brake band, 2½ in.

1908 Austin Models

6 Cylinder Austin, 90 H. P.

6 Cylinder Austin, 90 H. P.

The 1908 Austin Models are designed to exactly meet my own personal require ments after 6 years of building high grade cars, and to fulfill the ideas of that class o owners who want the "sportiest" kind of a car it is possible to get with *all* the powe and speed they can possibly use—a car that is either a touring car or a runabout capa ble of making a 1000 mile trip any time, and will beat anything on the road.

Our 6 cylinder 90 h. p. model is my idea of such a car—and I believe it stand today without an equal in the Automobile world at any price.

Our new combination body as a touring car has an extra folding footboar chauffeur's seat. The tonneau seat can be replaced in 3 minutes by a rumble seat thus converting the car into a runabout of the very latest design.

The equipment is complete in every respect, and includes both seats, and extensio surrey top for the touring car, and single top for the runabout. We also furnish thi new combination body on our regular 60 h. p. model in place of 7 passenger tourin body. This regular standard body, either with or without detachable limousine top will be furnished on both 60 and 90 h. p. models.

All Austin cars have the celebrated Austin Motor and are built in our own shop under my personal supervision.

Send for Catalogue and detailed information about our new models.

7 are 10½ inches for 1908. The Mitchell s use external and internal rear hub m brakes only, no line-shaft brakes, all brake shoes, both external and in-nal, are fiber-faced, making the sub-ntial brake diameter increase for 1908 hly important as the fibre-faced brake e must have ample diameter to obtain ability. The brakes have sufficient sur-e to hold the cars securely with a very it pressure, and it is well known the e-faced brake shoe gives less trouble n anything else until its safe load limit exceeded.

will be used. The motor cam shaft diam ter, originally ¾, is increased to ⅞, and t cam face width has been doubled, and now 1 inch. The applied middle beari of the 1907 cam shaft is made integral wi the motor base for 1908, and its cap retained by a screw which bears on a st spring, so that no injurious pressure ca be applied.

The general form of the motor, valv and valve action remain the same for 190 The bore of the 20 H. P. motor has bee increased from 3¾ to 4 inches, the strok remaining the same, 4 inches.

Two minor changes are made in th valve action, which is direct for the intak valves, and an overhead beam for the e haust valve placed in a cage in the midd of the cylinder head. The overhead bea is worked by a long vertical push-ro screw adjusted in the top fork for lengt and having the lower end dropt into cup in the top end of the cam roller carr ing lifter. In 1907 this cup was applie to the top end of the lifter. For 1908 th lifter diameter is slightly increased, an the lifter is made longer, permitting th push-rod cup to be formed by drilling d rectly into the top end of the lifter. Th intake valve stem length, fixed in 1907, given a screw length adjustment for 190 by threading the valve stem end and a plying a threaded sleeve with a spl hexagon end projecting downward belo

Fig. 7. Mitchell 1908 Control. The outside hand lever is pushed forward to first disengage e clutch and then apply the exterior rear hub drum emergency brakes. The inside hand lever ifts the change gear. Both hand levers are latched. clutch, special leather faced, with six gradual engagement springs at the forward end has been improved for 1908 by the introduction of an absolutely secure spring retention. The eight-lead mechanical oiler is retained for 1908.

Fig. 8. Mitchell 1908 rear axle construction. Described in the text of story.

THE AXLES.

The front axle is a steel drop forging, I-section, no welds, Lemoine type of stub axle support. The 1908 touring car stub axle dimensions are reduced for the lighter cars. The balls are ½ and ¾ inch diameter, respectively, two-point bearings, adjustable. The steering arms are applied. The rear axle is on Hyatt rollers, except the inside bearing of the bevel pinion shaft, which is an annular ball-bearing. All thrusts are taken by ball disks. The balance gear is eight spur pinions.

Fig. 9. Mitchell 1908 front axle, with dimensions. Steel drop forging, no welds.

The springs are 2 inches wide, tongued, grooved and banded for all cars. The exact numbers of leaves are not yet determined, and so are not here given. For the touring car the springs are 40 inches long in front and 48 inches long in the rear. For the two runabout models the front springs are 40 inches and the rear springs are 44 inches long.

THE CHANGE GEAR.

The gearing is all steel, all oil tempered, all 1⅛ inch face, 6 d. p., 8 d. p. tooth length, commonly mentioned as "pitch 6-8." The motor car sliding gear presents so many difficult problems that the motor car designers have been forced to adopt all possible betterments, and are now making the gear teeth shorter than standard lengths, saving outside diameter of gears and gaining in strength of gear teeth, and saving in surface machine work and in the amount of metal to be removed in gear cutting. The aluminum gear box lower member has integral lugs. The gear box

Fig. 10. Mitchell 1908 5-passenger car stub axle. The construction of the stub axles for the smaller cars is the same, with smaller dimensions.

cover deeply cupt, is a grey-iron casting held with plenty of bolts, and very greatly stiffens and strengthens the aluminum casting gear box lower member. All the shafts are in plain babbitt boxes, cast directly in rough dove-tailed seats in the gear box and cover.

1908 MOLINE 1908

THE changes in the MOLINE line for the coming season are such as to make the Four Cylinder Cars very much more handsome in general design, more quiet running, and more powerful in action.

The same high standards of workmanship are maintained as to details of construction, upholstering, and painting so that MOLINE cars are second to none in the American market.

The Two Cylinder Car has given such unqualified satisfaction that it is being continued for 1908 in exactly the same style and at the same price. It is positively the best looking and easiest riding two cylinder in the market. . On the question of speed and power you may judge for yourself, our catalogue gives the size of the cylinders and names the actual weight, and we stand ready to make demonstrations any time.

We are open for agencies in a few good cities.

All crank shafts, bearings and wrists, all pistons and rings, all cam shafts, all bevel pinion shafts and all rear axles are ground true. The cylinders are finished by reaming.

CONTROL.

All control linkage members are above the gear box, in plain sight and readily accessible by removing the driver's footboard. All connecting links are forked. The interlinkages are two, both relating to the brakes only. The brake shoes are not applied thru eveners; the pressure applied to each brake shoe is regulated independently by screw adjustment, this being deemed less unsafe than the automatic brake effect equalization by the use of eveners. Steering is by a worm and worm-gear segment. The spark and throttle positions are regulated by two rock shafts, parallel to the steering column and placed in front thereof. These rockers have each a ratchet retained hand lever at the top end, under the steering hand wheel. The outside hand lever is pushed forward to first disengage the clutch, and then apply the exterior, rear hub drum, emergency brakes. The inside hand lever shifts the change gear. Both hand levers are latched. The left pedal disengages the clutch only. The right hand pedal when pushed forward first disengages the clutch and then applies the internal ordinary, rear hub drum brake shoes. A small horizontal accelerator pedal varies the throttle opening.

The Mitchell motors and the Mitchell front and rear axle construction are original designs by Mr. John W. Bate, supervising engineer of the Mitchell factory since March, 1904.

ON THE ROAD

Saturday, October 5, a Mitchell, 1908, four-cylinder, 5-passenger touring car, driven by Fred Haumerson, Hugh Dolnar passenger, left the Racine Hotel, Racine, Wisconsin, at 7.50 A. M., for a two-day tour in the beautiful Geneva Lake district 40 miles west of Racine.

The weather was perfect, the coloring of the landscape was magnificent, but the roads, ungraveled deep black soil and clay, barely dry from the deluging rains of a week before, were very rough.

The country is full of small, beautiful lakes, many of them surrounded by summer cottages. This charming lake district has many, winding, hilly roads, graveled and extremely good, which are much used by motorists during the summer season, and the run from Elkhorn to Delevan. Delevan to Geneva Lake and Geneva Lake to Elkhorn, a triangular course of about 30 miles total, is over some of the finest gravel road in this country.

The Saturday's drive was about 75 miles over almost all rutted roads, where the Mitchell four-cylinder showed to great advantage, the springs being very easy indeed, and making the drive a real pleasure in spite of the rough going.

Sunday the car was on the road all day, covering over 150 miles, including four round trips between Elkhorn and Delevan, 14 miles each, averaging about 26 minutes, and from Delevan to Geneva Lake and Elkhorn, about 22 miles, over a fine road and thru beautiful country, in 40 minutes with seven passengers.

From Burlington to Racine the road is natural black soil, barely dry from soaking rains, deeply rutted and rough. We passed everything on this dried-mud stretch, as the Mitchell 4-cylinder springs are extremely easy in fast going over rough roads, especially with a full load. We very seldom ran faster, however, than 45 miles, but our average speed was high. Most of the time the car carried six or seven passengers. The only pause made for adjustment was a stop of two minutes in Delevan to reconnect a wire to a spark-plug. This particular 14-mile Elkhorn-Delevan round trip was made in 26 minutes, elapsed time total, including 3 miles of slow pace in the speed limits of the towns.

This two day's work was a real touring run, for pleasure only, no haste, visiting and carrying full loads of women, children and men, much of the time seven passengers; the Mitchell 1908 4-cylinder takes all the hills of this district, many of them steep and long, with no slacking of pace, is very still, very easy riding indeed, and is, in short, a real touring car.

The design and character of the Gray & Davis 1908 searchlight is so distinctive that the design patent was allowed without question.

The committee of the Automobile Club of America, appointed to select some emblem suitable for attaching to members cars has adopted a neat plate which can be attached to the dashboard or radiator. The plates are about three inches square, made of brass with the words Automobile Club of America at the top. In the center is the club flag enameled in colors on a black background, while at the bottom there is a serial number.

September was another record breaking month in registrations at Albany, N. Y. Ford again leads with a total of 90, with Maxwell 49, and Cadillac 36.

The Pennsylvania license tags for 1908 will be yellow and black. The hangers will be yellow background with black figures.

With the view of increasing the funds for placing additional road signs in the vicinity of Geneva, N. Y., the Geneva Automobile Club voted at the last meeting to increase the membership dues to $4.00 per year.

A Strong Statement— but a True One about the

The distinguished successes of the present automobile season, you can name on a very few fingers. And however you name them, the Elmore must come first.

First, we mean, in point of swift sales; the quick clean-up of the entire output; the call for more cars than our big plant could build; and the magnificent satisfaction which every Elmore in use is giving its owner.

Each Elmore season has surpassed the previous one---each year has seen its prestige grow greater and greater and greater.

In 1908, we promise you that the Elmore will be the most perfect car of its class in America.

CHAS. E. DURYEA

TOO HIGH COMPRESSION.

Hampton, Va.

I would like your opinion as to the trouble I am having with a double opposed that I have designed. It is a 5½x5-inch. The valves have a 2-inch opening. Exhaust lifts 5-16 from seat, and the suction ¼-inch. Both are mechanically operated. The engine runs fine up to about 475 r. p. m., and if opened up any faster has a heavy knock. Everything is tight; the knock is not caused by any lost motion. The cylinders, rings and pistons are ground.

There is ⅜-inch clearance between piston and head of cylinder. The blue print will give you all details of cylinder. It is a marine engine, turns 22-inch wheel three blade with 22-inches pitch. I sometimes think that the compression is too high, and it fires too early on that

account. I get about 80 pounds on the gage when I turn the engine over by hand, and it jumps up to about 130 when running without firing in cylinder with gage on. I want the engine to turn the wheel up to 600 without any noise or thump. I would be pleased to hear from you through the "Journal" in regard to same.—F. J. R.

It is quite plain that your compression is too high. You evidently get the 80 lbs. when turning slowly with the engine cold, and possibly some leak, all of which keeps the gage low. Put a check valve in the pipe to the gage so the pressure can get in, but not out, and test one cylinder without firing, while the other runs. Have this tested cylinder hot before opening the gage cock, and you will get the actual compression, which will probably be found to be over 100 lbs. You can make sure that it is pre-ignition by a simple experiment. Note at what speed it knocks, and then adjust the carburetor so as to give it a lean mixture, and again note the speed. If it permits a higher speed without knocking you can feel pretty sure of the trouble. Be sure it is not a loose fly wheel. The shape of your piston head is bad. It not only leaves a small combustion space, but this space tends to heat the piston head needlessly. Piston heads are convex in vertical engines, to keep the oil out of their centers, but should be concave in horizontal or inclined engines. This shape would give you more space or you can put a spacing ring under the cylinder flange. I would use one ½-inch thick.

C. E. D.

CAUSE OF BACKFIRING.

Phoenixville, Pa.

Would like you to answer through the Mechanical and Technical Department: What is the cause of explosions in the carburetor, and how to remedy them.—A. P. B.

Carburetor explosions are usually due to a lean mixture. A slow burning mixture may continue to burn till next opening of the inlet and then ignite the charge in the supply pipe. An over-rich mixture may do the same, or a badly mixed mixture may contain drops of liquid which carry over the flame. Try adjusting the carburetor by opening the gasolene needle or tightening the auxiliary valve.

This backfiring seldom happens with suction opened valves, for the speed of the air past the valve is too fast to allow the flame to propagate thru the small space, but the mechanically operated valve opens wide and the speed may not be great enough at the early part of the piston stroke to prevent backfiring. A later opening or a less lift of the inlet valves may stop it, and this should be tried if the mixture is correct and gives bluish flame.—C. E. D.

IS THE ROPE DRIVE PATENTED?

Chicago, Ill.

Will you please inform me thru your columns if there is any patent on the rope drive.

G. E. BILLETT.

It has been some time since I read the Holsman patents, but my recollection is that the rope drive is patented. There are other methods equally good and cheap, so do not let that worry you. Find one and have a drive that you can patent for yourself.—C. E. D.

GAS ENGINE QUESTIONS OF INTEREST.

Cleveland, O.

Please answer the following questions in your valued paper:

1. Will you please explain by diagram the piston ring construction used in the Haynes and Reliance. I believe, which you mentioned some time ago as better than the "snap ring" practice?

2. What is the minimum safe thickness for the cylinder wall of a 3¾ inch by 4 inch, 1-cylinder high speed motorcycle engine?

3. Would it be practical to use 80 pounds compression?

4. How does the most efficient compression of a gasoline motor compare with the most efficient compression of a kerosene motor?

5. How is it possible for some firms to put out a kerosene motor which does not carbonize at all—i.e., burns clean, whereas some or most gasoline motors carbonizing some?

6. Where can you buy high-grade steel magnets for magnetos?

7. Is three enough for the magneto on a single cylinder? I mean for the low tension friction driven type. I notice some have six—three inside and three outside.

8. Could one be made to spark a make and break apparatus without a spark coil? How?

9. Where can you get mica insulating washers for make and break plugs?

10. I would like to see the compound gasoline engine discussed and explained a little more fully in your columns. It seems to me that exploded gas and steam must act in a very different way, and therefore while the compound is successful for steam it might not be at all the right thing for a gas engine whose propelling force has not a gradual expansion. I should like to see figures showing the power developed by a compound over and above that developed by an engine of the same size exhausting in the open air. The testing plant of the A. C. A. ought to do something of the kind. It seems to me that at the end of the power stroke there is not enough power in the gas "to shake a stick at." To what extent am I wrong?—V. R. SCHERMERHORN.

The Haynes Company on application very kindly furnished the cut of a cylinder section showing the arrangement of the rings, and a description as follows:

"The ring is what is known as a multiple piston ring, and is composed of three parts. Two outside ones which are half the width of the inside ring, and telescope the inner ring. The width of the inside ring is about one-half inch, while the two outer rings are each about one-quarter inch width. These rings are all made large in diameter, and are placed in the cylinder under compression, so that they have a constant expansion pressure.

"Pins are placed in the outside of the inner ring at opposite positions to prevent the outer rings from changing position, and the joints are so arranged as to prevent leakage of the gas.

"Another special feature of this piston is the use of a ring around the cross head piston pin or wrist pin, there being a groove made in the center of the pin in which the ring is sandwiched between the cylinder wall and the cross head pin. The object being to prevent scoring of cylinders by the lateral working of the pin."

A slightly cheaper construction has often been used by me which consists of a ring of clock spring steel placed inside of the regular ring with joints opposite. Both these constructions have for their object a tight joint. In the usual ring with diagonal straight-cut joint the gases have a small but free path past the ring, then around the piston part way to the next ring joint, and so on. As the cylinder and ring wear away the opening and the joint gets larger and the piston wears smaller, so the gases find less obstruction and the engine loses power and heats more with age. With a lap or step joint ring there is no straight passage thru the joint, but the gas must go in at the joint on one side, then down under the lap, and up at the joint on the other side of the ring and lap, a crooked and difficult passage.

If a full width ring is inside the usual ring it is quite plain that the gas cannot get under the usual ring, and cannot get past the lap joint, so the ring is equally tight all around. A thin ring of steel pinned to the outer ring so the joints cannot get together adds stiffness to the thin worn outer ring and closes most of the passage, but being thin it is not so certain to hold the gas against passage around its edge and under it as is a thicker, better fitted ring. It is often of value to repairmen and others wishing to fit up an old engine without making new rings.

In the Haynes construction the use of two outer rings with joints staggered permits the use of any type of joint with equally good results, and is a superior construction, tho expensive.

The minimum thickness of wall depends on the iron, the probable distortion under heat and the amount of compression. If free from strains and of good quality 1-16 wall will suffice, but since you cannot be sure on these points I would advise not less than ⅛-inch, and even this may be found too thin to machine easily and profitably.

Eighty pounds is used in some engines, and will serve all right at high speed for auto work. The high compressions are more efficient than low ones, but this does not prove them best. I much prefer a low compression for auto work because such an engine more nearly behaves like a steam engine, and this is what is wanted. The average auto user is not out riding to save gasolene, and smooth running with great flexibility is what he prefers. I do not know that any kerosene motors are in use for auto service, and do not know how the compressions should be. I think about the same, or lower.

To burn clean requires a lean or weak mixture, and not too much lubricating oil. A little water injected at each explosion or at the end of each day's run will clean the walls. Most stationary engines take full charges or none, but auto engines are throttled and will miss fire with a lean mixture, so they usually run with a fat mixture. If provided with a carburetor adjustment near the operator he can make the mixture lean when great power is not needed, and let the excess of air burn out the carbon deposits.

For magnet steel inquire of the magneto makers. They will doubtless be willing to accommodate you with a small amount.

Three magnets will serve, or even two, but some folks are not willing to get along with the least possible spark, and it is not wise to save at this point. If weight is a serious object perhaps the magnet weight can be made to form part of the flywheel. A magneto will ignite a charge without a coil, but not so certainly. I tried to stop my motor recently by short-circuiting the coil with a piece of metal across the coil posts, and failed. The magneto was a Wizard. The armature serves as a coil in that case, and its core as the coil core. To employ the armature this way use a fine winding and plenty of it. The alternating current magnetos do not use a coil, and are obliged to depend on the armature discharge. Some dynamos make a beautiful spark if the contact is only an instantaneous one.

Mica in any commercial shape can be had of A. O. Schoonmaker or the Mica Manufacturing Company, both of New York City.

We were promised some test figures by the makers of the Compound last spring, but have not seen them thus far. There is considerable power in the exhaust at the end of the working stroke, but most engineers believe it costs more to use this than it is worth.

I have been using it quite successfully to introduce the new charge in a stationary engine, and will describe the method fully in the near future. It has been used to heat a thermopile and produce electricity. Also to drive a turbine or windwheel. The hot gases are much different from steam, as you suggest, for they have no latent heat and so lose their heat and pressure to the walls of the pipes, valves and cylinders very quickly; whereas steam may increase in amount as the pressure decreases by the evaporation of water drops which under pressure remained a liquid,

Most Conspicuous

ACTUAL count in many localities will show Goodrich tire preference—and numbers are a pretty good argument too; but, better argument and bigger evidence is found in the fact that all these Goodrich tire users have a prime good reason for their choice—they have been attracted to Goodrich Tires by

GOODRICH TIRE DOINGS

It is popularity derived from everyday occurrence of notable good work, as well as from the service given in such long distance endurance events as the Glidden Tour where *Goodrich Tires were conspicuously ahead in both numbers and final honors.*

Digitized by Google

but turned into steam as soon as the pressure was taken off. There are several ways of using this power without much complication, and it is likely that some of them will be employed in the near future.

Mr. Victor Lougheed has recently patented an engine in which he retains only a partial charge of mixture, and has a very small compression space, but not unusually high compression. This permits him to expand to the full end of the stroke or far beyond the original charge volume, and thus utilize the pressure at the usual exhaust point.

Your suggestion that somebody ought to make tests is a good one, but who is to be the cat's-paw to do these things for the benefit of others? We are so afraid of paternalism in this country that altho we restrict our liberties by all sorts of fool laws we do not have very many institutions where experiments of this kind of untold benefit to the land can be worked out. Some of the States now maintain agricultural experiment stations, with the result that farming is making progress by leaps. Mechanical and chemical stations of a similar nature would pay just as well.—C. E. D.

WHAT TYPE OF ENGINE GIVES LEAST VIBRATION?

Hyde Park.

Please answer the following in your Mechanical and Technical Dept.

What style of gasoline engine will run with the least vibration, a four cylinder upright or a double opposed 4 cycle?

How should a double opposed engine fire to give the least vibration, and how should it be placed in the carriage for the same purpose, crank shaft crosswise or lengthwise the carriage?

Will a 4-inch dia, 4-inch stroke, 4-cycle engine be large enough for a four-passenger car?

Can such an engine be air-cooled without giving trouble, or will a water-cooled engine give better satisfaction? Is there any objection to a horizontal engine in a car? An upright engine carried in front seems to me to give the front wheels too big a load. But accessibility probably makes up for the disadvantage. I want an engine as reliable as possible, smooth running, and with power enough for fair speed, and hill climbing.

I have a modern machine shop to do the work in, and am willing to spend lots of time on the work to get a good engine and car, but am in doubt about what is most suitable, as I have looked over several cars, and they all claim to be the best.—W. O. K.

There is very little choice in the matter of vibration as to the arrangement of 4 cylinders. If only one fly wheel is used, it is probable that the opposed type will vibrate less, since all of the cylinders are close to the wheel. With cylinders lengthwise the body of the vehicle is the best way to place the motor to avoid vibration. It is about the only way a single cylinder can be placed because of the vibration, but the multiple cylinder affairs vibrate less, and so permit other placings.

A 4-cylinder 4-cycle should fire one-half revolution apart, and there are several ways possible. The cranks must be 180 degrees apart, and you can quickly bend up a piece of soft iron wire and try the various sequences possible in your mind. This will help you to grasp the problem. I would use a two throw shaft for a 4 cylinder 4 cycle opposed, and put two connecting rods on each single long crank pin. This makes less bearings, and is very compact, and uses a shorter, cheaper chank shaft. With the odd cylinders on one side and the even on the other, it may fire 1, 2, 4, 3.

Four 4-inch cylinders will suffice for a car weighing not over a ton. Air-cooling is all right if it is carried out right. If you have had no air-cooling experience, and your car is not extra light, don't attempt air-cooling. Water is a more brutal and wasteful way of cooling, but it gets there, and prevents damage. I look for a wider recognition in future of the fact that a gas engine is a heat engine, and that cooling is a loss, and hope to see engines that are able to develop their power without boiling away so much water. Horizontal engines are all right. Stationary horizontal engines bring the highest prices. If you intend to make the whole car, you can put the engine at the rear over or behind the rear axle with very short chain drive, and with passengers between the wheels and very light front. This arrangement has many advantages not yet appreciated, or at any rate not yet worked out. If you expect to buy parts, better follow conventional designs. There is no best. All designs are compromises, and all builders differ in their opinions as to what must be sacrificed. The racing man sacrifices everything to the motor and puts it in front where he can see it. The public some day will lose the crazy idea that they are all racing sports, and will awake to the fact that the front seat is the best one, i. e., between the wheels, and then the motor will be moved to the rear in short order. By that time builders will have learned how to couple up a motor to a rear axle without turning a corner or two by means of bevel gears and without needing the whole length of the vehicle to get their machinery in.

C. E. D.

WHEEL SIZES AND GEAR RATIOS.

Los Angeles, Cal., August 24, 1907.

If a car with 32-inch wheels is geared 4 to 1, what would the gear be if wheels were increased to 34 inches? Also a car geared 3½ to 1 with 36-inch wheels, changed to 34-inch wheels?—F. A. B.

You misunderstand the terms used. "4 to 1" means that the engine makes 4 turns to 1 turn of the rear wheels, and increasing the wheel size does not change this, but it makes harder work for the engine, and should be accompanied by a similar change in the size of the large bevel gear, or an inverse in the bevel pinion. Suppose the pinion to have 16 teeth and the gear 64. If the wheels are made 34-inch the gear should have 68 teeth, or the pinion be reduced to 15 teeth.

If the wheels are reduced 2 inches or 1-18 of their diameter, the big gear should be likewise reduced or the pinion increased. This matter of expressing gearing is not a definite thing as it should be and can be, since it also depends on the wheel sizes. We formerly used "miles per hour" to express the gear, but with the advent of throttled engines capable of varying from 3 to 30 miles on throttle this ceased conveying the little intelligence it formerly exprest and was dropt. The present expression makes one figure out the wheel size just as the old bicycle rating in inches of wheel diameter per turn of crank did. A better method is inches of road surface per turn of engine. Thus your 4 to 1 gear with a 32-inch wheel on direct drive will travel forward 8 times 3.146 equals 25.13 inches in one turn of the engine, while the same gear with 34-inch wheel will travel 8½ times 3.1416 equals 26.7 inches at each turn of the engine. —C. E. D.

DETERMINING THE VOLTAGE OF A COIL.

Morristown, N. J.

Will you please tell me how I can tell for what voltage a coil is wound? I have a coil made by "T. Carpentier, Paris." Any information that you will give me, I will be very thankful for.—E. LAWS.

The coil and its condenser are supposed to be wound and proportioned one to the other, and if the proper battery is used, the condenser will prevent much spark at the contacts. Test it with different voltages and use the one that gives the best spark with the least sparking at the contacts. If you increase gradually, you will notice the increased sparking before you reach a voltage high enough to hurt the coil. You can get a fair idea of the number and size of sparks by drawing a card or paper between the plug points.—C. E. D.

Universal Type Engine

The One Best Engine For Buggy-Type Automobiles

Suitable for any light runabout or light delivery wagons, but designed especially for buggy-type rigs.

Two cylinders, 4x4 double opposed.

Conservative power rating, 10-12 H. P.

Weight, including flywheel, 180 lbs.

Over all dimensions, including spark plugs: length, 30″; width, 16¾″; depth, 17″. Depth without flywheel, 11½″.

Perfectly balanced. Entirely free from vibration.

Air-cooled, and **cooled** beyond question. Has been run at full speed for six hours without a sign of distress. Big exhaust valves. Careful construction. Best materials.

Every engine fully guaranteed to deliver the rated power and keep cool.

Prompt delivery on any quantity to those who order promptly. Attractive prices in quantities.

VIBRATION AND ORDER OF FIRING.

Taunton, Mass.

As a subscriber of the "Journal" and an appreciative reader of your many answers in the "Mech. and Tech. Dept.," the writer would like your opinion of the following:

Having found certain mechanical advantages in valve operation by having crankshaft throws as shown in the sketch, the firing to be as either row of figures indicate, the question of vibration is giving me some serious thought. The engine would be used in a heavy truck, on three point suspension, and turn not over 800 r. p. m. at full power.

The navy dept. recently resorted to spring suspended skeleton models of triple and quadruple expansion engines to prove a similar question, applying power to crankshaft and noting visible results. But before going to such an extreme I would greatly appreciate your opinion of this condition, either from experience or theory, as the vibration may be enough to offset other advantages.

CHAUNCEY C WALKER.

Your arrangement is all right. You can make a shorter engine by connecting both pitmen to a single pin and placing the cylinders in two V-shaped pairs. The vibration will be slightly more, as you have proposed, but not enough to be objectionable if you gain advantages by this placing. The vibration will be in the plane of the cylinders, one end of the engine tending to rise as the pistons go down, and the other vice versa. A fly wheel or clutch at each end will remedy this.

Your firings are all alike, in that the left end cylinder follows the right end one and the right middle comes next, followed by the left middle, and repeat. You simply begin to count in a different place in a continuous line of explosions. You can make the left middle follow the right end and the right middle next, followed by the left end and repeat. Or these two general arrangements can be reversed.

In short, without puzzling over it much, it looks to me as if 4 different cam arrangements are possible, whereas you have been considering one only. Numbering the cylinders from right to left, as shown below the diagram, two orders of firing are possible with this crankshaft, namely, 1, 4, 2, 3, or 1, 3 2, 4, or the same orders may be followed beginning at the other end if desired. C. E. D.

FUNCTION OF COMMUTATOR IN DOUBLE IGNITION SYSTEM.

I beg to acknowledge receipt of your favor of June 21 in response to my inquiry thru the "Cycle and Automobile Trade Journal." If it is not intruding too much on your good offices, I would appreciate a little further information, if you could tell me the function of the commutator when used as shown in your sketch? In other words, tell me in a few words how it works when the four posts are bonded together?

FRED G. PERRY.

The magneto distributer serves for all the sources of current. When the magneto current is used the commutator is not used, but with either battery it makes and breaks the current four times in its revolution and the distributer sends the sparks from the single coil and its wire H to the proper plug. C. E. D.

BRAKES GRIND AND RATTLE.

Milwaukee, Wis.

I have a 2-cylinder, 22 H. P. car which has been run for about 5 months. I notice when running if the brake is applied, that it gives a sort of grinding noise. It seems to work perfectly, probably expands too suddenly, and when car is standing a rattling noise can be heard when the brake is applied. Can you advise me if same ought to be adjusted?

A. S. HOFF, JR.

Inspection is the way to find your trouble. Brake bands that are nearly dry often grip and let go and repeat this in a very disagreeable and destructive chatter. If they hold too severely a little oil on them stops this, but if they are not holding dangerously harsh, a little dust, such as common chalk (not talc. French chalk) will serve to roughly lubricate and will stop the chatter without interfering with the braking ability, but will often increase the braking grip. The rattling may also be due to a loose brake rod.—C. E. D.

QUESTIONS ON 4-CYLINDER DESIGN.

Fort Wayne, Ind.

Would you please give me the information I ask for concerning a 4-cylinder 4-cycle gasoline motor, cylinders to be 3¼x3¼? What should be the diameter and lift of the intake and exhaust valves?

How much would you offset the cylinders from the center line of the crank shaft, and how much offset is correct for the cam shaft?

Will a 1-inch Schebler carburetor be sufficient?

About what compression space should be allowed? Also, what should be the compression in pounds?

How long would you make the piston and piston rod?

How should explosions take place—crank shaft made of a flat slab, cranks being opposite and not set on angles?

How much larger do they generally turn the pistons rings than the cylinder bore?

Do you think that common machine steel will be O. K. for 1¼ crank shaft?

How far from the inlet valve do they generally place the carburetor.

This engine should be air-cooled and pull a thousand-pound Runabout.

What horse-power should it give?

CHAS. F. STEPHAN.

It is not the purpose of this dept. to design engines for individuals, because the space is too limited to devote to a subject of interest only to a single reader, and because the designer to do a decent job, should have more information than a short letter of inquiry contains. Thus, if you want a high speed engine, the valve must be larger than if you prefer to run slow and get the vehicle speed by gearing. The compression should also be more than on a low speed engine.

If you will read the recent numbers of this Journal, you will find most of your questions answered, or find description of some good motor near enough to what you want for you to copy, and thus take no chances.

Briefly, make the exhaust valve one-third the piston diameter, and the inlet one-fourth, with a lift of one-fifth of their diameter. A little larger than this for air-cooled, unless you use an auxiliary exhaust part.

Set the shaft center one-third of the crank length (one-sixth of the stroke) to one side of the cylinder center The cam shaft offset depends somewhat on the size of the cam and roller. Duryea cam shafts are offset the full amount of the lift You may find a 1-inch carburetor too large.

Use about 50 lbs. compression, make the piston longer than its diameter, and the connecting rod about twice the stroke. There are several crank arrangements possible, and very little difference between them. Look at any 4 cylinder engine and select. The piston ring should open at the joint about ¼ inch, unless it is quite thick, in which event less will serve.

Put carburetor 1 to 3 feet away from valves. You ought to get 12 to 15 H. P.—C. E. D.

The ═══ *Model*

Air-Cooled and Water-Cooled

We offer this season two strikingly beautiful models.

We offer, with increased confidence, the latest improved Marmon Air-Cooled Motor, which for many years has proven beyond question its thorough efficiency under all conditions of hard service.

One of the new features of this remarkable motor which will appeal to the expert is the Marmon One-Piece Detachable Cylinder Head, removed or replaced in a moment, dispensing with valve cages entirely, reducing engine noise to a minimum, and making the valves, pistons and cylinder walls instantly accessible.

To those who prefer water-cooling, we offer the Marmon Water-Cooled Motor of marked excellence, unusually simple, accessible and durable.

Both the air-cooled and Water-Cooled types carry the complete guaranty of this House.

Marmon Touring Cars are much longer and roomier this year. The body hangs low and is designed in a graceful straight-line effect.

All models embody those exclusive features which have won The Marmon its fame for mechanical superiority, such as Double Three-Point Suspension, Marmon Lubrication, Roller Bearing Steering Column, Marmon Multiple Disc Clutch with Cork Inserts, and Marmon Selective Transmission.

Model G, Touring Car, 35-40 H. P., $3000. Model H, Touring Car, 45-50 H. P., $3500; Model H, Runabout, 45-50 H. P., $3500.

A full description of all models will be furnished promptly on request of Dept. 15.

The Easiest Riaing Car in the World

Model H, 45-50 H. P.
$3500

Built by one of the World Best Know Engineerin House

The Marmon account for 1908 offers a very attractive proposition. We have some open territory for first class agents.

CAUSE OF BENT RADIUS ROD.

New York, N. Y., Sept. 10, 1907.

In the August issue of your journal, page 84, Mr. G. Austin Morrison, Jr., desires information in regard to bending of radius rods.

In your answer you state that without a sketch you cannot properly understand the reason for same. As I have had trouble of the same kind, on a similar car, will endeavor to explain, if the accompanying sketch does not explain itself.

When backing the car, and applying the brakes all the strain comes on brake shoe

No. 2, which being expanded at B, and pivoted at A, locks itself on the 11" dia. brake drum. and the 11" leverage is fully exerted on the threaded part of the rod and causes it to bend. The lower shoe having no support except the spring will lock on the drum, while the upper shoe always has a solid rest, by stud A, and expanding dog B.

All this trouble can be prevented by having the radius rod bent at the end as per dotted lines, and by swiveling the brake shoes at C, and expanding them at D, which greatly decreases the leverage.

HUGO VON RODECK.

QUESTION OF REDUCING FUEL USED.

Will you kindly advise me how to improve the following engine: Two cycle 4 inch bore 5-inch stroke used to run printing and job presses? The owner claims it takes as much to run the small job press as the large one; the engine runs all the time and drives a 30 or 39 foot shaft, nearly 2 inches in diameter, two counter shafts and the job press, or if the job press is cut off it runs the big press and folding machine. From 4000 to 6000 prints are made every week on the big press and folded, and something more than that on the job press. The engine consumes from 20 to 31 gallons of gasoline a month, speed 380, regulated by a butterfly valve below the mixing valve. Jump spark ignition is used. I can see no way of reducing the amount of gasoline consumed. Any suggestion will be appreciated.

I wish to experiment on a 4 cylinder air-cooled engine, the cylinders to revolve around the crank shaft, crank set at 180 degrees, so two pistons will work out and two in, the same as two double opposed auto engines, only set like an X. I think this will be as well balanced as any opposed engine with cranks set at 180, but wish to have your advice.

I wish to have the inlet valve in the piston head, and the exhaust valve in the center of the cylinder head, so the exhaust will be around the valve, and leave by two opposite ports.

What compression space would you advise as best? There will be no pocket in the cylinder, the head being half round. How deep should the fins or ribs be? If I use copper flanges 1-16-inch thick, what width would serve the best? Will copper cooling flanges brazed on the cylinder be better than integral iron ones?—I. B. A. B.

I do not see that you can greatly reduce the gasoline bill. The engine must run itself and the shafting all day, whether the presses run or not, and a gallon a day does not look extravagant. Possibly a larger pulley could be used and run slower. Be sure your spark is made at the best point, that the engine is not over-cooled, and that your exhaust gas has no odor, for odor means wasted fuel. Sometimes a little water sprayed in by a second carburetor nozzle will increase the efficiency.

Your revolving 4 cylinders will balance nicely and work all right, but the gain due to this design is questionable. The difficulty of oiling, adjustng and getting in the charges are against this type of engine.

I see no objection to having the valve in the piston head, but it must be mechanically opened or balanced, for if not, the centrifugal force will affect it variously at different rates of speed.

Make the compression space one-third to two-fifths as long as the piston movement. There is no advantage in making the cooling flanges very high if they are thin. Five to 10 times their thickness is enough. If you get good contact and have plenty of them three-eighths of an inch high and one-quarter inch apart, ought to cool. Copper is better, but not enough to pay.—C. E. D.

WANTS A CAR FOR HILLS AND MUD.

Lacona, N. Y.

I am a subscriber to your Journal, and wish to ask you, is there any car suitable for deep muddy roads and hill climbing. I do not like a horse, and as the season is advanced, it is buy a horse or another car.

DOCTOR.

My candid opinion, which may be biased by my pride, is, that no rig in the world can take the mud, hills, snow and sand like a Duryea. It is built for that purpose, and embodies a dozen or more years' experience with autos in bad roads, winter and summer, which no other rig does. The reasons why it is able to do what others cannot, are many: It has very high power in proportion to the weight, and delivers that power at the large rear wheels, on which the load is carried, so there is no slipping, no skidding, no tearing of tires, and no heavy front end to push. You can carry a load thru a muddy spot easier than you can wheel it on a barrow. It is a runabout, and yet can carry six when necessary. It is most accessible and very simple. If you prefer a more conventional design, seek large wheels, light weight and high power with simplicity. If an auto-buggy will please you, select a thoroly tried make, and not one that is on the market for the first year, or radically different from its last year form. Good things do not change a lot every year. If in doubt, inquire of a user.

C. E. D.

WHY WON'T IT RUN?

Frostburg, Md.

Being a reader of the "Cycle and Automobile Trade Journal," I would like to ask a few questions regarding a single cylinder engine that is used on a Cleveland small touring car. I think the machine was built in 1904.

1.—When cranked, it makes one explosion and stops, and acts so several times, before starting, and after starting it won't speed up any. It doesn't develop enough H. P. to run it on the level. In the high speed the engine stops and refuses to run at all. I have a good strong spark, and the carbureter on it is the Schebler.

SAMUEL GASKILL.

You do not give enough symptoms to form a good opinion. See that the valves are timed properly, and that the compression is good. Then if you have proper mixture and spark it will go. Probably you are feeding too much gasolene, but it should run some when cold. Your spark may not be strong enough to jump under compression. See if you can get a spark at the coil terminals ½-inch long. Perhaps the timer has slipt on its shaft and the spark is not taking place at the proper time. This will also cause the engine to act as described. When you locate the trouble we will be glad to hear what it was.—C. E. D.

WANTS ROLLER CHAIN TO FIT BLOCK CHAIN SPROCKET

Holly Springs, Miss.

I have an automobile that is driven with a block chain, 1-inch pitch by ½-inch wide. I want to use a roller chain on it without changing sprockets. I wish you would please let me know if there is a roller chain made that will fit a block chain sprocket, and the name of the firm that makes it.

H. W. BRYANT.

I do not know of a roller chain which will fit the block chain sprockets. Possibly the maker of such, if there is any, or some of our readers seeing this, may be able to advise. You can easily write the chain makers whose advertisements appear in our columns and inquire. You may be able to get better block chains than the ones you have had in the past. Better steels are now on the market than when block chains were common and the makers now appreciate the importance of putting better material into their product.

Faulty material and inadequate design were the two faults that largely killed the block chain. In the cycle business the block chain had survived the roller and proven its right to the public's favor by its superiority over the roller chain. But when the auto arrived, it was put to a new duty far beyond its strength, and entirely foreign to the uses intended for it by its designers and builders. Its failure caused the public to demand something else, and they got it, not in larger and properly made block chains, but in roller chains much heavier and more costly, not to mention their noise and complication. But the chain as a transmission device for motor vehicles can hardly be beaten, and some day in the not far distant future, the block chain will again come to the front, and people will wonder why it was not used before. This short history may help you to understand why you are not likely to find a roller chain to fit your sprockets.—C. E. D.

WANTS ENGINE DIMENSIONS.

San Francisco, Ca..

I am a subscriber of the "Cycle and Automobile Trade Journal," and am building a gasoline traction engine. I would like for you to send (if possible) the detail dimensions of the cylinders and valves, the shaft and cams and conecting rod of a Thomas Flyer, 60 h. p, 1907, or a 30 h. p. 4 cylinder light motor boat engine of good manufacture.

J. M. JOHNSON.

You will find description of a 30 h. p. S. & M. boat motor on page 251 of this Journal for April, '06, with many details. Also a description of the Thomas 60 on page 176 of the December, '06, issue. Other descriptions in past issues will furnish many valuable and practical pointers.—C. E. D.

2 Cycle Engines

HUGH DOLNAR.

WHAT IS THE DIFFICULTY?

Stockton, Cal.

I am sending you blue print of an engine I built some time ago. I have been a close reader of the writings of Mr. Malcolm, deceased, and this engine was built fairly close to his ideas as laid down for size of parts, etc. According to figures, the engine should develop some 50 odd H. P.

The absence of section hatching and of important dotted lines and the manifestly incorrect exhaust and intake port sections, make it very difficult to tell exactly what the construction is. The intake port is 5-16 long, and extends nearly half way round the cylinder. The exhaust port is ⅝ long, same circumferential extent as the intake port. The crank-box port is 5-16 long, circumferential ex-

Cross two-cycle motor, four water-cooled 5-inch bore cylinders, 4 inches stroke, should show about 75 H. P. at 1200 R. P. M. Does show from 6 to 10 H. P. at 800 R. P. M., which is its best rate under load.

It runs light up to 1300 R. P. M. but under load, we cannot get more than 800 out of it, with about 6 to 10 H. P.

Am using 1908 Holley Carburetor, with 100 lb. fly wheel and ordinary rope lined brake for testing. Can you give any idea why we cannot get more power out of it? I hope this may enlighten some others as well as myself.

H. N. CROSS, M. D.

tent not shown. The side-pipe from the crank-box to the intake port is far too small in cross-section area. The deflector, integral with piston, which directs the entering charge upward in the cylinder is ⅜ high. The crank box is filled with pieces of wood fixed to the crank-arms, as much as is possible, but the long lug on the left side of the rod-box on the crank-wrist, at A and the rod-cap hinge

Digitized by Google

at B. demand a large clearance in the crank-box and taken in connection with 5-16 crank-box intake-port, which has not nearly enough area, and the extremely long pistons, 6⅛ ins. for only 4 ins. stroke, probably reduce the crank-box pressure to 1¾ lbs. or thereabout. For the 2-cycle rod the cap should be held with screws, one or two, on each side of the wrist, and placed as close to the wrist as is possible. The screw bodies need not clear the crank-wrist by more than a sixteenth of an inch: this construction keeps the wrist end of the rod small as possible, and greatly reduces the crank-box clearance. The 2-cycle piston length can well be much less than the piston stroke, instead of more than 1½ times the piston stroke as in this example.

One and a half inch diameter carbureter and exhaust pipes are used, the exhaust pipe over the carburetor pipe, but the ports are bridged and the passage is greatly impeded by the bridge, as the exhaust pipe is not enlarged at this point.

There is no gain at all in very short ports up and down for the 2-cycle motor, and all the ports are far too small in this example. When crank-box pressure is used all clearances should be as small as possible. The unloaded maximum R. P. M. of this motor is given at 1300; it should have been at least 2200. With everything as it should be four 2-cycle cylinders 5x4 ins. should show at least 75 B. H. P. This is simply a case of restricted respiration; the motor cannot breathe. With two 2-cycle cylinders Gulick showed 51 B. H. P., cylinders, 5½ ins. dia., if I remember rightly, and 5 ins. stroke, crank-box pressure.

In my opinion the 4-cylinder 2-cycle motor is altogether a mistake; 3 cylinders, 2-cycle give same torques as the 6-cylinder 4-cycle, and the 4-cylinder 2-cycle is as much of an error as the 8-cylinder 4-cycle motor.—H. D.

Difficulties Successfully Overcome by Users

Under the above heading we will be pleased to publish how *you* solved *your* automobile difficulties. Many troubles have been successfully overcome by means of the answers in these columns. We earnestly urge those who have been thus benefited or any who have overcome such difficulties to send a brief account of the same to the Editorial Department of the Cycle and Automobile Trade Journal.

HOW TO REMEDY KEROSENE BURNER TROUBLES.

Reading Mr. C. S. Lawton's troubles with a kerosene burner, I wish to say I use the same make of burner, only 18 inch, and after about 3 months' fooling with it, trying to make it steam and pilot stay lighted, and spending quite a little on pilot rods, I set out to improve it or unprove it, as it might come out.

I first took a fine saw and sawed the slots larger. This saw would nearly go into the slots, but not quite, so I cut it down as far as slots went, put it on the car, and, to my surprise the old thing steamed very well, and has not troubled me much since. I find, however, where kerosene is used it soon gums up the regulator and valve tips, and the slow steaming is blamed on the burner, when it ought not to be. After using kerosene for about two weeks, fill a tank with ½ gasolene and the rest with kerosene. This will clean the system out nicely, and your car will steam well, or if you put one gallon of gasolene into the tank each time, this will do away with the gum which is the cause of so much trouble in kerosene burners, and the pilots will work much better.

I carry 400 lbs. on a large touring car, with 6 aboard, and have no trouble as a rule to hold steam, and carry only 50 to 60 lbs. of air on the main tank and pilot.

Speaking of the roaring noise which I have heard a great many users of this burner kick against, I can say it never has troubled me any, except if turned on the hard before good and hot it will roar badly for about two minutes, and then stop.

As for carbon, I never have seen any since my burner was put on the car. My gas is so dry it cannot be seen after the burner has been going a few minutes.

My pilot, which troubled me considerably by going out, I remedied by making the hole in the end large enough to let the carbon dust pass through, and since then have never had it go out.

I put under the seat an old Mobile muffler tank, and use a very fine copper tube to the pilot, using a Tee with this, connected to the Tee with valve, and connected to the kerosene line. To start the pilot I use a gasolene torch and just warm the outside pilot, which takes about two minutes, then let on the gasolene and warm the main nozzles, and in three minutes after I have started to heat the pilot the full burner is going with no oil at all. This pilot I let run until ready to start out, then close the gasolene and let on kerosene. In this way I never have had any trouble whatever, not even in starting, as the gasolene seems to clean it out thoroly. If the pilot has been going all day, when I put it out I open the gasolene line and close the kerosene, and let it burn gasolene for a half-minute or so, then put it out.

I fill the small two-quart tank ½ full of gasolene and pump up 45 lbs. I have not used two quarts all summer for starting. I do not trouble at all with the pilot tank; in fact, hardly ever look at it, as long as it fires.

This will do the work perfectly, and is not such a tiresome job as Mr. L. makes of it, which would discourage me so I would never use a car. I lighted my car one evening, and was out of my garage with 400 lbs. in less than ten minutes, and have done it in six, with 300 lbs., to see what I could do.

Be sure your pilot rod is hot, or it will smoke and flood badly. If it is thoroly hot, you will have no trouble, or, at least, that has been by experience.

I know one party who had three of these burners and could not use them, and he filled up the slots and it did no good. That is not the trouble; the noise is due to such a high air pressure, and will never be overcome until the burner is made with more slots or larger openings, and 50 to 60 lbs. are used. I have run my car on good state roads on 30 lbs., and had no trouble whatever to hold steam at a speed of 15 miles per hour, as long as the road was good, but on 60 lbs. it will make any old road or hill with ease, without falling off of steam to speak of.—J. A. W.

The Seitz Automobile and Transportation Company has been presented with three acres of land and $1,000 in municipal bonds by the Common Council of Monroe, Mich. The company in return will erect a factory costing $8,000.

The Hess-Bright Mfg. Co., Nineteenth and Hamilton streets, Philadelphia, maker of H-B ball bearings, has opened a New York office at 131 West Street Building, West and Cedar streets, with R. D. MacDonald in charge.

Helmet Oil Ends Your Oil Worries

Helmet Oil gives the same amount of lubrication on a cold day as on a hot day. Temperature does not affect it. You do not have to watch the lubrication of your car when the days change in temperature.

If you use common liquid oil, the bearings require constant watching. If the day is hot, liquid oil becomes thin, flows too readily, the bearings are flooded and the supply is exhausted. On the other hand, if the day is cold, the liquid oil congeals, flows slowly and is very slow acting. Helmet Oil is not affected by heat or cold. It is not a liquid oil. On account of its "body" or density, the temperature of any day does not affect it. Helmet Oil does not contain an atom of pitch, gum or acid. It will give you perfect satisfaction on every bearing in your automobile.

The merits of Helmet Oil can be thoroughly demonstrated on *your* car *free* of expense to you.

Try It Free—Write for Booklet

Send us the name of your dealer and we will have him give you a free sample to try. Put it on the bearing that is giving you the most trouble and you will find that it will give perfect satisfaction.

Rambler Automobiles

For the year 1908 the entire facilities of the Rambler factory will be devoted to the production of two Models, 34 and 31.

Model 34, a five-passenger touring car with four-cylinder vertical motor, 32 horse power, has selective type transmission with shaft drive. The wheel base is 112 in., wheels 36 in., with 4 in. tires. Price, fully equipped, $2,250. The same chassis, however, with appropriate changes in detail, will be equipped with a roadster body with rumble seat, at the same price.

Model 31 is a five-passenger touring car with detachable tonneau, equipped with the Rambler unit power plant, comprising double opposed motor, multiple disc clutch and planetary transmission entirely enclosed. Price, fully equipped, $1,400. This model can be furnished with torpedo deck in lieu of the tonneau, at $1,300.

Both models have been brought to the highest possible degree of perfection in every detail that insures

Service, Economy and Comfort

A complete line of 1908 Ramblers will be shown at a private exhibit at the salesrooms of the Homan & Schulz Company, 38-40 West 62nd Street, New York City, during both New York Automobile shows.

You cannot afford to miss making a critical inspection of these 1908 models of

wo touring cars, Model "G" listing at 00.00, and Model "H" at $3500.00. Both e four-cylinder, air-cooled, 90 degree ors with improved detachable head nders.

odel "G" is a five-passenger car of 104- wheel base, equipt with a handsome ight line aluminum body. It has 4½-inch rear, and 34x4-inch front

he new Marmon 1908 detachable head, air-ed motor.

els, quick detachable rims and tires; clutch; selective transmission; shaft e; roller bearing steering column, and osed fenders.

ne Model "H" is also a five-passenger with sufficient room for two extra s. The wheel base is 114-inches and 4½-inch rear, 34x4-inch front, quick chable tires are used. The body is of aluminum, beautifully designed with a bination of straight line and curve t. It has selective transmission, im-

provement. A head with radiating flange containing the exhaust and inlet ports an valves is held securely to the cylinder b four long studs passing thru the flange to the crank case. This construction doe away with separate valve cages, reduce the number of joints, makes the moto quiet and gives easy access to the valve cylinder walls and pistons for grindin the valves and cleaning out carbon de posit. It is only a moment's task to re move a head, and it is they say as quickl replaced without disturbing adjustment

The Model "H" car will also be fu nished with a 5-inch by 5-inch four-cylin der water-cooled motor to those who prefe it, and a Runabout using the Model "H chassis will complete the line; both o these being listed at $3500.00. The wate cooled motor is of the Company's own de sign and construction. It is of regulatio pattern, four vertical cylinders with larg shaft and bearings, long connecting rod large valves, intake on one side and ex haust on the other, Marmon oiling systen magneto, etc.

1908 "MARMON" AIR-COOLED MOTOR.

The principal improvement in the Ma mon 1908 Air-Cooled Motor is the type o cylinder used. Heretofore the cylinder were in one piece and secured at the base to the crank case and the valve were in separate cages held to the cylinde heads by studs. The improved cylinde 5-inch bore, 4½-inch stroke, is made in tw pieces, as clearly shown in the illustratio of the parts. The head is one castin with radiating flanges and contains the in let and exhaust ports with air space be tween them. This construction does awa with valve cages, the large valves bein seated directly in the cylinder head.

1908 Hatfield Buggyabout

eld Motor Vehicle Co., Miamisburg,
made but few changes in its popu-

powerful enough to take the car any place

Chassis Plan of the Hatfield Buggyabout.

at a moderate speed. Its road clearance of eighteen inches is very advantageous in traveling rocky or stumpy roads or in crossing small streams. Solid tires are used, reducing tire up-keep expense to a minimum, but the vehicle rides easily on account of its having large wheels and long flexible springs. The makers lay particular stress upon the quality of this car. The buggy part is built just as well as it can possibly be made. All sills, reaches, etc., are heavily ironed and it is claimed will stand hard usage for years, with practically no expense outside of tire renewals, say once a season.

The mechanical parts are in accordance with the buggy part, in that the engine is especially designed for this service, and every part is thoroly tested before it is put in place.

Finally, when the car is ready to ship

600 cars in 1907, about 500 of which
e five-passenger touring cars, and 100
e three-passenger runabouts, same
e, $2500 for each.

1 1906 the company adopted the I-sec-
steel drop forging axle in place of
tubular front axle before used, and
ut 100 of the 1907 Wayne cars had I-
ion, drop forged front axles.

o date the company has put out near-
500 tubular front axles with not even
single instance of failure of the body
tubular front axle. The Wayne Com-
y sold in 1906-7 about 200 I-section,
l, drop forged front axles, all drop
ed in two pieces and electric welded
ne middle. Up to August, 1906, seven
ne electric welded axles had failed at

steel, stub axle yokes and applied ste
casting spring pads.

For 1907 the Wayne cars had the slidi
gear box combined in an integral, alun
num alloy casting with the bevel ge
housing of the rear axle. This gear, 6-
chrome nickel steel, tempered, selecti
change, has given satisfaction, and is r
tained for 1908.

The Wayne 1907 motor, four, 4-cycl
water-cooled, 4½x5¼-inch cylinders.
retained, with only a few changes of d
tails.

The 1907 wheel base, 107 inches, is r
tained for 1908, and the same wheels, wit
tires 34x3½ inches front and 34x4 inche
rear, are also continued. The fron
wheels are on ball bearings, and the rea
axles are on Hyatt roller bearings, rea

Fig. 1. Wayne 1908 5-passenger touring car. Wheel base, 107 inches; gage, 56 inches; tires, ½ inches front, 34x4 inches rear; motor, 4-cycle, water-cooled, 4½x5¼ inches cylinders; nom-35 H. P. at 1100 R. P. M. Selective, sliding gear speed change in box integral with bevel housing, 3 forward speeds and a reverse. The wheel base is 107 inches, prest steel frame, inches spring eye to spring eye, 4 inches greatest depth, half-elliptic springs, torsion arm no struts, with two outside hand levers, two large pedals and a small accelerator pedal, exterior and interior rear hub-drum brakes, all fiber-faced, applied thru eveners. The board is of mahogany, flat, open for the touring car and cowled for the runabout; so far thing is about in the middle of 1908 practice. The two Wayne features making pretence vergence from the beaten path are, combining the bevel gear housing and the change gear nd the placing of the internal expanding clutch shoe inside the clutch internal drum, inte-with the fly wheel. Neither of these thoroly tested variations from the more ordinary ice cam make any pretence to novelty. The tonneau body side doors swing to the rear. The au seats three passengers, and the usual two seats are in front. Weight, about 2400 s. Price, $2500, including 5 lamps, mats, horn, tools, gas generator and cape top, all for extended touring.

eld, and at that time electric weld-
as abandoned, and all forged axles
hereafter were hand welded in the
, with no more axle failures re-

the fact that no steel tube Wayne
ver failed, and the consideration
e I-section axle is stronger up and
than it is sidewise, while the steel
as equal strength to resist stresses

wheels retained on the tapered axle ends with keys and nuts, all the same for 1908 as in 1907, these important details having proved wholly satisfactory.

The springs and chassis frames are continued unchanged, as are the Blood Brothers universal joints, and the right and left screw thread steering gear.

Fig. 3. Left side of Wayne 1908 Motor. The cylinders, 4½x5¼ inches, are cast in dual ts. The fan and oiler are belt-driven from the gear shaft. The whole motor design is good ulation practice, no novelties and nothing out of the way.

es are all the same, nickel steel, heads stems integral, ports all 1⅝ inches eter. The water jackets, including are integral with the cylinders, and the water piping is copper brazed in tw members, with a length of rubber hose t the radiator on top and from the radia tor to the gear-driven, two-pinion, wate

AUTOMOBILE TRADE JOURNAL

Fig. 4. The Wayne 1908 Clutch. This company adopted the internal, fiber-faced, expanding e in the internal, cylindrical brake-drum integral with the fly wheel in 1907, with a diameter 8 inches. For 1908 the Wayne keeps everything same form, but increases the clutch-drum meter to 10 inches inside.

This clutch is normally engaged by the pull of a coiled spring on the bent long arm of a l crank whose short arm pushes the free end of the fiber-faced flexible shoe, fixt at the mo- n leaving end, into contact with the internal clutch-drum surface which revolves toward this plied end, so that the fly wheel rotation puts the clutch on. In this action the clutch spring only to establish the shoe friction and the motion of the clutch-drum does the rest, so that 0 pound spring tension is ample. The curved bell crank arm carries the disengaging roller fork. This roller is pushed outward by advancement of the pedal actuated clutch cone

IMPROVED BARRETT AUTOMOBILE JACKS

The improvements incorporated in the 1908 "BARRETT" JACK place it as far ahead of former models as the "BARRETT" has always been in advance of ordinary jacks. To its numerous superiorities of operation and construction has been added still another—the new reversing lever, which controls the direction of the jack's movement, up or down.

Working at the front of the jack and displacing the side eccentric or thumb screw formerly used, the reversing lever is always accessible with greatest ease, no matter in what position the jack may be placed under the car. It is in ready reach without groping between the spokes of a wheel or crawling beneath the car. It is not even necessary to reach under the car with the hand to operate the lever—a slight blow with the jack handle will set it as desired in a second. That this clever appliance adds greatly to the efficiency and convenience of the "BARRETT," increasing its speed and making it far more handy to apply and remove, is not to be doubted.

The "BARRETT" is the only automobile jack on the market possessing this new and requisite aid to safe, speedy, accurate operation; and patents fully covering it are pending. The improved "BARRETT" is made in sizes with heights of 8, 10 and 11 inches, and raises only on the downward stroke of the operating handle. It is perfectly adapted to use on any motor car, irrespective of size or make.

Another new and worthy characteristic of the "BARRETT" is the tube steel handle, so strong it cannot break or bend under the heaviest motor car, yet so light it can be used with greatest ease.

CAUTION

Motor car buyers should insist on having the genuine BARRETT AUTOMOBILE JACK supplied. Inferior jacks patterned after the 1908 improvements here described are worthless imitations. Refuse any jack but the "BARRETT."

With these added features of utility and convenience, increasing immeasurably its effectiveness and facilitating service under all circumstances, the "BARRETT" is now, more than ever, the best and safest jack for your car's equipment.

The "BARRETT" is supplied by leading automobile manufacturers, and may be had of responsible dealers everywhere, or direct from us.

SPRINGFIELD METAL BODY COMPANY.

Digitized by Google

lowing the latest fashion of a clean dash. The McCord oiler is carried on the front of the dash under the hood, and a hole or window in the dash enables the driver to see the oil supply. There is 30 inches foot room between the dash and front seat, which is an increase over the touring car. The steering post has been given more rake, and all the brackets and step hangers have been moved to suit the new type of body. Tires are carried racing fashion at the rear in special combination holders, which also form the tail lamp bracket.

The foot pedals have large hinged tops, which fit the bottom of the foot, and a muffler cut out, pedal actuated, is provided. The steering wheel is 18 inches in diameter instead of 15, as on the touring car. The tools instead of being in a box on the running board are in a leather roll, which can be carried to the point where needed. A brass toe rail has been fitted on the floor of the left front seat for the use of lady passengers. A Prest-O-Lite gas tank and Warner auto meter are furnished as part of the regular equipment on this model. The car has a clean-cut "get-there" look, and is apparently a great favorite at the factory. The body is finished in cirilean blue, striped with three adjacent pin lines of Autocar red, giving a very unique decorative effect.

NEW BRAKE FACING.

On the contracting band brakes on the rear hubs a combination of camel's hair belting and manganese bronze has been adopted. On the upper band alternating segments of belting and bronze are used with a small crack or space between. This combination, it is claimed, gives several advantages. The belting prevents rattling, and the bronze prevents burning out, while the edges of the blocks and the spaces between act as scrapers to clean the drum and dispose of the dirt laterally. It is also said that the combination has never been known to squeak.

TOURING CAR CHANGES.

Thruout the entire construction there has been an increase in the amount of nickel steel used. On the running boards pyramid rubber is used with a new hook type of brass moulding, which gives the effect of a half round on top and fastens on the edge, giving a much neater smoother finish than the flat screwed on strip formerly used. A patent leather shield has been placed between the running board and body, and at the rear an aluminum box similar in appearance to that over the driving sprockets of side chain cars, acts as a step to the tonneau.

The distinctive hand grip control of the spark and throttle in the steering wheel is still used, but the grips are now of hard rubber. The right or spark control grip is red, and the left or throttle grip is black. The front fenders are not so flaring, are flatter on top, and are now provided with a splash shield between them and the body. The radiator will be polished brass instead of enameled, as in all previous models. The distance between the front gas lamps has been increased, giving more room for the starting crank swing. A new and decorative hand rail type of brass dash moulding is used. An Atwood generator is this year supplied as part of the regular equipment.

THE DOCTOR'S RUNABOUT.

The water circulation system in the small runabout has been slightly altered, some of the shorter bends in the piping having been straightened out, and a brass frame has been placed around the radiator at the front. All parts which have at any time shown the least sign of weakness have been replaced by nickel steel parts. A Solar generator, gas lamps and top are now included as part of the regular equipment. The unit power plant which proved so satisfactory last year has been continued. The car sells for $1200.

Ignition Pointers

The question of electrical ignition is a subject of interest to amateur and professional alike. The following suggestions are from Mr. J. D. Maxwell, of the Maxwell-Briscoe Motor Co., who, in speaking on this subject, gives the following dont's:

Don't forget to test the batteries and note that they are strong; don't guess.

Don't screw down battery connections with your fingers, use pliers.

Don't let the various electrical connections become corroded, but keep them clean. You cannot get a good connection with dirty terminals.

Don't run an accumulator or storage battery till exhausted.

Don't make electrical connections by using simply a stript wire, always use a regular battery terminal and see that the wire is securely fastened to the terminal. It pays to keep your ignition system up.

Don't allow your electrical wires to become oil soaked.

Don't use a coarse file to true the vibrators; platinum is expensive. Use only a dead smooth file and use that sparingly.

The American Motor League is distributing to its members, free of charge, Duryea's practical little hand-book entitled, Roadside Troubles."

Mr. E. R. Thomas, of Buffalo, has been appointed chairman of a committee of the Automobile Club of Buffalo to give life to the proposition of constructing a boulevard for automobiles between Buffalo and Niagara Falls, a distance of a little over twenty miles. Mr. Thomas's plan is to have a wide dirt road, coated with some suitable preparation that will keep dust and prevent damage by rain, and also restrict the road to the use of motor vehicles.

A Little Talk on Lamp Efficiencies

Regardless of advertising, and getting down simply to optical principles, what really is the most efficient auto lamp? That is, what form of reflector, lens, or mirror actually projects the greatest amount of light from the acetylene flame?

The parabolic reflector comes nearest to surrounding the flame, and therefore receives the greatest amount of light on the surface. If it reflected all the light it receives, it would be by far the most efficient.

But no metal reflector can be kept bright in the presence of burning acetylene. It absorbs nearly all the light, and reflects only a trivial percentage.

The bullseye lens absorbs but little light, but its form is not mathematically correct. It scatters the light passing through it, and only the central rays are so nearly parallel as to carry far. The rest give near-by illumination only.

The plain spherical mirror likewise scatters the rays, as it has no true focus. This scattering is avoided in the Lens Mirror, whose thickness is graduated from center to periphery to compensate for the tendency to scatter, and thereby produce a true parallel beam.

A lens mirror cannot "surround" the flame, but it may be—for a given diameter—close to it, or not so close, according to the focal distance. The closer the flame, the more light the lens mirror will intercept and project. A short focus lens mirror is deeply curved, and is therefore expensive to grind.

The intensity of the projected beam bears a mathematical relation to the shortness of the focal distance. A larger flame does not make a stronger beam, only a broader one. For high speed at night, the long-range beam given by a short focus lens mirror is essential to secure safety.

ATWOOD

QUALITY LAMPS

Skill in the building, care in selection of material, and practicability as well as beauty in designs have made the Atwood Lamps and Generators the foremost product of their kind in the world. Constant improvements, the most severe tests upon completion, and careful and minute inspection through every process of construction have conserved the reputation for quality so consistently earned during 35 years in the building of lamps.

ich trips the contact arm or hammer, l completes the electrical contact with anvil. The spark occurs at the in- nt of the breaking of this electrical con- t. The eccentric is held in position one clamp screw, so that the timing the ignition is very easily regulated by position of the adjustable eccentric the vertical shaft. The periphery of eccentric is notched, as will be seen in cuts illustrating this mechanism. The iter contact arms or hammers and the tact points or anvils are of iridium, ich offers great heat resistance, and therefore not readily burned away by

circuit cut-out button is fitted on the da board, so the electrical circuit may cut out when the motor is cranked for i spection purposes.

The Garford engineers were pioneers the use of the low tension make-and-bre system of magneto ignition, being the fi to use it in this country. The system do away entirely with the use of batteri coils, sparks, plugs, intricate high tensi wiring, commutators, etc. A double s of ignition with its necessary duplicati is not necessitated for actual runni service, its sole advantage, if any, bei for starting purposes only.

Fig. 2. Right side of Garford Model B, 40 H. P. Engine. For details of the construction ignition system see text.

sparking. The whole system is con- lled by the spark lever on the steer- wheel in connection with the single ating shaft having four worm gears, rotation of this shaft is in turn con- lled thru beveled gears mounted on of a vertical shaft set between the ond and third cylinders.

All the bearings on the four vertical ifts which operate the make-and-break chanism are equipt with automatic ck-feed reservoir oilers. To protect the ving parts of the ignitors from the d, grit and dust, which is sucked in by rapid movement of the car thru the , and the added influence of the fans

The starting crank instead of having t usual single tooth has four teeth as aid to easy starting. The graceful shap hood of the three hinged type is lined w asbestos cloth to keep the motor h from penetrating thru the hood, and a prevents the motor from getting too c in the winter when standing. Cleanline noiselessness and freedom from rattle a provided for by fitting raw hide lacing der the hood ledges and the ledges the radiator and dashboard. The gasol capacity is twenty gallons, the fuel bei carried in a tank under the operato seat.

ig. 4. Rear cross spring and member of the ford 40 H. P. car. Note the integral gusset es and depth of this member, and the ex- ne camber of the spring and its method of ening.

ved so as to allow for plenty of mo- n. The rear platform spring well bolt- to the rear cross member of the frame, of course fitted with universal double

Fig. 5. Garford Torsion Lever. This lever is 42 inches long, of prest steel, pinned and zed to the differential housing. It is tapered, as shown, to about 1½ inches at the forward , where it is held by an adjustable shackle from the center of the middle cross member of frame.

ckles, the lower links of which are ra short so as to limit to a minimum side sway.

'he final drive is thru a propeller shaft m the gear box, the shaft being fitted h two double universal joints. The ve being also taken by two adjustable l ended struts or jack bolts. A prest et steel torsion lever forty-two inches g tapering from its extreme width of inches, where it is pinned and brazed the massive differential case by four- n 5-16 rivets down to one and one- rd inches in width, as shown by the stration. It is held at the front end an adjustable shackle from the center the middle cross bar so as to allow ne up and down play between a pair of rt, heavy, helical springs. The rear e, which is of the well-known floating e, is covered with a large tubular type aged axle sleeve, its diameter at the erential case being two and five- hths inches. The rear axle and differ- ial case are split horizontally, so that y can be readily taken apart by re- ving half a dozen bolts and without king up the car.

Annular two-point bearings of the con- tional foreign type are used in the

and thirteen ¾ balls in the inside be ing, the whole rear axle being firm braced by a truss. All the spring hange are fitted with oilers, and the rear si spring front hanger is combined with t stud of the running board hanger, th obviating an extra frame bracket. T front springs are without the usual cent bolt, which causes breakages, being cli by an outside hanger onto the front ax

THE CHANGE SPEED GEAR.

A new type of selective sliding gear used, giving four speeds and one rever with a direct drive by means of a fo tooth clutch on the third speed, the four

speed being geared higher than the spe of the motor. Any set of gears can meshed without cutting thru the oth

Fig. 6. Plan of part of Garford Chassis, sh ing the clutch brake and accelerator pedals, oiler, change speed gear case and selective c trol levers. For complete description see te

Digitized by Google

The compact gear set case is made of aluminum in three pieces, and is firmly anchored to the sub-frame by four feet. All the shafts are arranged vertically, and run in F. & S. imported German two-point annular bearings, and not set into the aluminum cases, but in separate bronze housings. The gears are of exceptionally wide face, having six pitch teeth, and are bolted to the flanges, so that no dependence is placed upon keys or set-screws to hold them in place. The main shaft on which the gears slide is made round instead of square, and is fitted with four longitudinal keys set at equal distances around the circumference. By rocking in the reverse gear on ball crank levers by means of a cam motion and a slide roller on an inclined plane, the shafts are shortened, which makes them naturally stronger. All the gear shift rods are entirely enclosed in the case, so they will operate under the worst conditions of mud and water, something that cannot be said of all selective gears. The gear shifts are also splash lubricated from the gears. When one set of gears is in mesh the other sets of gears are positively locked, so that there is no possibility of two sets of gears getting into mesh at once. The ball bearings on the gear set are oiled by a mechanical lubricator operated by the motor, so that they do not have to depend upon the splash from the case, and the possibility of dirt and sediment from the gear case working into the bearing is avoided.

The complete chassis weighs a little less than 2000 pounds. It is the intention of the Garford Company not to fit this chassis with factory-made bodies; hence nothing is said about their construction here, the idea being to fit them with specially constructed bodies from the hands of the most celebrated coach body makers in the West, in the East and in New York City, leaving the selection to the buyer.

The Garford chasses will be distributed directly to the trade and the public from their offices in Elyria and Cleveland, O., and in New York City by the Garford Motor Car Company, 1540-1542 Broadway.

News Notes

Cedrino, driving a 35 horse-power Fiat car, won the second twenty-four-hour race at Morris Park track, New York City, September 27 and 28, covering 984 miles.

March 21 to 28 is the date announced by Manager R. M. Jaffray for the holding of Toronto's automobile show, to be held in the St. Lawrence Rink, and April 5 to 12 for Montreal's exhibition in the Arena.

Buffalo's sixth annual automobile show, under the auspices of the Automobile Club of Buffalo, will take place in Convention Hall during the week of March 9 to 14, 1908. Dai H. Lewis, secretary of the club, will have charge of the show.

Upon the return from Europe of R. E. Olds, president of the Reo Motor Car Company, Lansing, Mich., the directors voted to give every employe in the Reo factory who had been there a year a bonus of 5 per cent. on his salary in recognition of faithful service.

Joseph W. Parkin, Jr., driving a 30 horse-power Packard car, won three of the events of the automobile races held on the half-mile track in the Fair Grounds at the opening of the Inter-State Fair at Trenton, N. J. The best event of the day was the ten-mile handicap with six cars contesting.

Two more motor car manufacturing concerns have been admitted to membership in the American Motor Car Manufacturers' Association, making a total membership of 51. The new members are the Continental Auto Manufacturing Co., of New Haven, Conn., and the Brush Runabout Company, of Detroit, Mich.

A seven-passenger, four-cylinder, Stearns touring car, owned by J. D. Hollingshead, of Chicago, and carrying its full quota of passengers, was driven to the top of Pike's Peak, Col., on September 6 by Frank Leland.

Secretary Robert O. Brockway, of the American Motor League requests that all automobilists who favor the building up of strong national, state and local organizations, send him their names and addresses at the League headquarters, Vanderbilt Building, New York City.

In order to lessen accidents to motorists caused by unseen ditches, gullies and railroad crossings, the American Motor League has called upon its members and proprietors of official stations and hotels along popular touring routes, to take up the work of erecting danger signs and guide boards to forewarn tourists. Several hundred of these danger signs have already been put up, and the League, received a new supply during October.

Mr. Pardington, in speaking of the Parkway, says that there has been many excellent reasons for delay, most prominent among which has been a number of hold-ups by real estate speculators whose work has had to be overcome. From reports which have been received from other sources it seems that men trusted with the secrets of the promoters of the venture, took advantage of these secrets to enrich themselves and so compelled a considerable change in the plans and in the routing, in particular, on the Speedway. The great roadway will be completed next year when the Vanderbilt and many other great annual contests will be promoted along the new course.

ine of cars with all the old and satis-
tory construction retained, and very
' changes. The principal models are
' 2-cylinder 18-20 H. P. five passenger
ring car; "B" 10 H. P. $650 four pas-
ger runabout, and "C" 2-cylinder 18-20
P. roadster.

'his 1908 18-20 horse-power 2-cylinder
) Model "C" Roadster is a handsome,
pely, attractive looking car. Its chassis
f the same complete design, simple and
stantial construction as of the touring
with higher gear, and backed by its
verful engine, gives the speed and effi-
ncy of many cars of higher price. The
ght is evenly distributed; the engine
seats are placed further back, insuring
nfort and making it an exceptionally
y rider. It is beautifully finished and

of the wheel has been increased from
to 28 inches, and they are equipt wi
three inch Michelin tires with Goodye
detachable rims. The price is now $650.(
the quotations being f. o. b. the factory.

DETAIL CHANGES.

The body of the touring car is roomi
and handsomer in every line; the back
higher; the engine develops more pow
while the motor and transmission a
more quiet. The diameter of the whee
has been increased from 30 to 32 inche
and they are equipt with 3½-inch Michel
tires with Goodyear detachable rims, i
stead of the 30-inch by 3-inch standa
equipment as heretofore. This insures o
inch more clearance for rutty and mud
roads, easier riding and longer life to t
tires, besides greater economy in gener

"Won't Slip" Tread Tires

1

They hold their own; they ho
the road,
And at no curve need they
slowed;
Upon the earth they keep th
grip—
And Bailey Tread Tires wo
slip.

2

They're Tires that hold t
Right O' Way,
They've come to go—and co
to "stay,"
And while you go the merri
clip
The Bailey Tread Tires wo
slip.

3

They're "knobby" Tires t
stand all strain,
The "Rubber Studs" are s
and sane;
The stretch of ice you need
skip
For Bailey Tread Tires wo
slip.

4

For Auto, Auto-Bi or Bike
They lead in speed on tr
and pike,
They neither ravel, rend
rip,
And Bailey Tread Tires w
slip.

5

They "corner" all the turns
with ease;
No "Heart in mouth" if you
have these;
No sudden short-turn brings a
tip
For Bailey Tread Tires won't
slip.

6

They are not skidders that
skidoo;
All roads are pleasure roads to
you;
The "Won't Slip" Tread, says
every lip,
Is rightly named "Won't
Slip." (A. W. B.)

The **world wide** popularity of the Bailey "Won't Slip" Tread Tire
been made entirely on its merits. The "mouth to mouth" advertising
those who **ride** them and who have found in them a tire which proves
reliability, durability and **superiority** over **any** and all anti-skid
tread constructions has made it impossible for **8** of the largest tire ma
facturers in the United States to supply the demand for Automobi
motor cycles and bicycle tires with Bailey Tread. There is no **metal** in
Bailey Tread to **heat** the tire, **pull** loose from the rubber or tear
road bed. The **rubber studs** of the Bailey Tread are the **true** princ
that give **perfect traction** and prevent **skidding**. They are to
Automobile what the **rudder** is to the **ship.**

N. B.—The extra cost of the Bailey Tread Tires on the List more t
smooth of same make, is 2½ and 3 in., $1.50 each; 3½ in., $2.00 eac
in., $2.50 4½ in., $3.00 each; 5 in., $3.75 each.

useful in automobile factories, garages, repair shops, etc. They can be carried anywhere, as any length lamp cord can be attached. This concern also makes hand drills in smaller capacities, and Scotch drills up to 2-inch capacities.

The Winton Self-Starting Device

The Winton Motor Carriage Company, Cleveland, O., is fitting its Winton Sixteen Six car, described in our September, 1907, issue, page 132, with a self-starting de-

Diagram of the Winton Self-Starting Device.

vice, which is a special feature of the car, but which was not at that time ready.

This device operates by taking a quantity of comprest gas from one cylinder at each compression, and storing the same in

Detail Sectional View of the Distributor Valve of the Winton Self-Starting Device.

a tank until needed. Part of the compression of the forward cylinder only is piped thru check valves (A and B) to the storage tank (C), which is located between the driving shaft and the left frame rail under the rear seat. Check valve (A) has spring pressure equal to compression, so that only combustion is taken. To operate the device with motor not in operation, the valve (D) on the dash is opened. This permits pressure to flow from the tank (C) thru the distributor valve (E), which is driven by the cam shaft, and is timed so that all the pressure contained in the tank enters the one cylinder ready to fire, each cylinder except No. 1 being equipt with the check valve (F), to which is attached the usual compression cock. Pressure entering the cylinder about to fire forces the piston past the firing point, which should at once place the motor in operation. However, should this cylinder fail to fire, pressure then enters the cylinder next to fire, and forces this piston past the firing point, and so on thru the series of cylinders until combustion puts the motor into operation.

A pressure gage (G) is placed on the dash, and has attached to it a release cock. The cock (H) is used for oiling the distributor valve.

The accompanying sectional drawing is an enlarged view of the distributor valve (E). That portion of the valve to which are attached the six outlets to their respective cylinders is stationary, while that portion thru which air passes from the tank to the outlet pipes revolves, being timed as before stated.

"Mason" Trunks, Tool Boxes, Etc.

John B. Mason Company, 318 Washington street, Boston, Mass., manufactures an attractive line of trunks and similar automobile fittings, and its line includes a cleverly combined tool receptacle and foot rest. The latter device is made of bass wood and covered with enameled duck. It is hand riveted and lined with tin. This combination style tool box and foot rest is for use in the tonneau, but they also make a tool box of similar construction for the running board, and a mahogany tool box for the running board.

They offer several styles of trunks made in both leather and enameled duck. They put out one type of leather trunk which can readily be carried in pairs, one on top of the other and firmly strapt together. They also have a double trunk—two trunks in one—made to fit any car. It has an inside tray, is all handstitched, and is made up in either patent leather or black harness leather.

This company also furnishes baggage racks made of tire steel, riveted together and practically indestructible. Robe racks of polished brass is another feature of the Mason line. These are adjustable for different thicknesses of robes and can be closed up when not in use.

Baseler & Lawrence inform us that they have formed a partnership and located at 1011 Chestnut street, Philadelphia, where they act as sales agents for electrical manufacturers.

Wright tires, or any tire using a rubb valve stem. It can also be used for men ing a tire in which the metal valve h begun to leak around its base. It is fu nished complete with cord attachmen plug and thermometer. The list price Type BV is $8.50.

The "Shaler" Type C Vulcanizer, for Out Casings, in operation.

The Type C vulcanizer is exclusive for outer casings, and will mend any blo out or tear to outer casing that it is pra tical to mend in any size tire from 2½ 5 inches in diameter. The vulcanizer 14 inches long and designed to fit insid the case, thus making it possible to vu canize a new canvas directly to the i side. It lists at $20.00.

"Preservative" Tire Paste and "Sterling" Auto Body Polish

"Preservative" tire paste is the produ of the Tire Preservative Company, Onawa, Iowa, and is used to lengthen th life of automobile tires. The preparatio comes in the nature of a smooth past which is compounded from the best know rubber preservatives, and when applie and well rubbed into the surface and a lowed to dry forms a perfect coatin which is claimed to exclude the air an preserve the rubber. It is recommende for use on both old and new tires, inclu ing tires in stock.

This company also manufactures Ste ling Auto Body Polish, a new oil polis which they guarantee will remove all san scratches and varnish blemishes and t restore the lustre to the varnish.

On October 1 Mr. Frank C. Riggs joine the Packard Motor Car Company, of De troit, taking charge of the Commercia Vehicle and Enclosed Body Department.

The Keyless Lock Company, Indian apolis, Ind., make special parts to orde for automobiles, such as hinges, lam irons, door handles, keyhole covers, an escutcheons.

Col. Sprague's 1908 Auto Front

l. James H. Sprague, president of the gue Umbrella Company. Norwalk, O., brought out an entirely new auto

and the 1908 fronts will be the unique and simple locking device which the Colonel has patented.

The 1907 device was a very good one but the 1908 lock is absolutely direct in its action and cannot rattle, and its movements are simple and positive. The new fronts also have a more elegant finish and appearance, and the number of parts has been reduced to a minimum, making the fronts simple in operation and not liable to get out of order.

"Troy" Combination Folding Glass Front and Bug Screen

The Troy Vehicle Sun Shade Company of Troy, O., have just brought out something new in the line of wind shields, the feature of the device being that protection can be had instantly with either a glass plate or a bug screen. The operation of the device is such that not only can the change from screen to glass and vice versa be easily and quickly made, but when desired both glass and screen can be folded down—the screen dropping in front and the glass to the rear of the stationary section.

The "Troy" Front with the Bug Screen Up.

The frame of this shield is made of highly polished brass, which with a little polishing will always keep it bright and new. In the stationary frame rubber bumpers are set, against which the folding sections strike. The sections are fastened by hooks at each end, which hold them securely in place. The device is claimed not to rattle, and is made to fit any dash.

means of the turnbuckle, which has been employed since the first Midgley detachable rim was placed on the market in 1904.

The "Mandeville" Steering Wheel Auto Muff

The purpose of the "Mandeville" muff is seen at a glance at the accompanying cut. The muff is manufactured by the Mandeville Auto Steering Wheel Muff Company, of Bluffton, Ind. It is shaped something like a bag. The top comes over the wheel and close to the body. The bottom fits around the post, having a suitably located ring which opens and snaps around the post. The top and bottom are fastened together by an adjustable strap. This arrangement holds them close enough to keep out the cold, yet free enough to give all the working room needed. The wheel turns freely inside this covering, as it is made wide enough to allow for the arm action in turning corners.

One style of this muff which is here illustrated is made with a celluloid wi

The "Mandeville" Steering Wheel Auto Muff. This picture shows the style with celluloid window.

dow in the top over the center of the wheel, which enables the driver to see all controls, and have the same freedom as an uncovered wheel would give him. They are made for winter and summer use. The summer style is of light weight rubber, and is rain and wind proof. The style for winter use is made of leather lined with fur, and lists at $15.00, or with celluloid window at $16.50. They make also another grade with better lining at $20.00 plain, and with window at $21.50. These muffs can be furnished in leather to match the upholstery of the car, if desired.

Chicago Cleveland

The Auto-Meter Won in the Glidden Tour

New York

Won in 1906 Won in 1907 in the Glidden Tour

Last year 38 out of 62 Cars entered in the Glidden Tour were equipped with Warner Auto-Meters, as compared with 55 out of 74 this year. At the finish last year 10 Cars out of 13 with perfect scores had Auto-Meters, and this year 36 out of 48 Cars that finished had Auto-Meters.

Won in the Sealed Bonnet Contest

Out of 68 Cars in the Chicago Sealed Bonnet Contest, 26 had Auto-Meters—the nearest competitor of the Auto-Meter had only 16 and the next 14, the next 7 and the rest—"nowhere" with 2 and 1 each.

Practically all Route Books Are Compiled by Auto-Meter

including *Motor Guide, The White Route Book,* Sidney J. King's Book, and the Routes issued by the *Automobile Club of America.*

From start to finish in the far-famed Glidden Tour this year the **Warner Auto-Meter** helped to win most of the perfect scores for the contesting cars. The **Auto-Meter** was installed

On 55 Out of 74 Cars AT THE START

in Cleveland. In this awful endurance test of keeping absolutely accurate figures on "How Fast" and "How Far" to Chicago, and then on to New York under some of the fiercest road conditions, there were **36 Auto-Meters on the 48 Cars that finished** at New York—**75 per cent** of the **Winners.**

Victory for The Warner Auto-Meter

On 36 Out of 48 Cars AT THE FINISH

That's going some. It's a victory for the **Auto-Meter** which might have been anticipated, because—

The magnetic principle which makes the **Auto-Meter** as reliable as a mariner's compass makes it unnecessary for the shaft to run at such a *wearing* high rate of speed, as on other speed instruments.

Consequently, experienced Motorists, like the Glidden Tourists, know that the **Auto-Meter** is the instrument that can be *depended* upon to stand hard endurance runs and *accurately tell* the *speed* and distance made by a car *from* start *to* finish without wearing out or being put out of commission like others.

That is also the practical reason why you'll see the **Auto-Meter** on the *Cream of all Cars* on any road.

Watch any line of Motor Cars anywhere—you'll see the handsome little **Auto-Meter** on the dashboard of the best of them and the most of them—then you'll decide that

You ought to have an Auto-Meter on Your Car.

Agencies in All the Principal Cities

Won in Almost Every Contest

The Auto-Meter is so immensely popular with motorists everywhere, and it is so universally used and depended upon to tell speed and distance figures, that it is only natural that it should be used by experts in all great contests and win the most victories.

Won the Chicago Reliability Run and Boston Endurance Race

In both of these hard tests the **Auto-Meter** was used by the majority of the entrants, and proved absolutely dependable under all trying conditions.

The Warner Instrument Co., 760 Roosevelt St., Beloit, Wis.

The "Jones" Automatic Speed Control Governor

The object of this device is to govern the speed of an automobile, the arrangement being such that the occupant of the tonneau or limousine may control the speed at which he wishes the vehicle to be operated and therby eliminate a great deal of the danger and uneasiness felt from reckless driving by the chauffeur. This device is the product of the Jones Speedometer Co., 76th and Broadway, New York City.

The "Jones" automatic speed control governor; A, speed indicator; B, automatic circuit breaker; C, controller.

It consists of an electrical switch having five or more points of contact representing circuits, the switch being operated by the action of the centrifugal governor of the speed indicator. This switch is so arranged that when a speed of ten miles per hour is reached by the indicating hand the switch will close the circuit thru the first contact, and when the velocity of the governor is such as to indicate a speed of fifteen miles per hour on the dial. the switch is caused to close the circuit thru a second contact point, and so on up to any desired number of speeds or contacts.

The controlling switch (C) is so arranged as to cause the circuit to be formed thru any one of these contacts controlled by the speed mechanism, as may be selected by the pointer on the switch dial, which closes only the circuit for that one particular speed. When this circuit is closed, say thru the ten mile contact, it actuates the circuit breaker (B), thru which passes the current to the primary of the induction coil, causing the cutting off of the spark on the engine, or by closing the circuit instead of breaking it, to operate an electrically controlled air valve, shutting off the air or gas from the engine, thereby shutting off the power and preventing the speed of the automobile from increasing the ten mile speed at which the controlling switch is set to indicate. When the controlling switch is set to read at fifteen miles, then the switch, when it reaches the fifteen miles contact, will cut off the power when that speed has been reached; but as soon as the speed is reduced to, say, fourteen miles, the contact cuts out and the engine gets its power again, and so on at the various points of contact.

If the pointer on the controlling switch is set at an intermediate position, then, of course, this device has no action whatever on the speed of the car any more than as if it were not there.

American Made Michelin Tires

The new Michelin tire factory at Milltown, N. J., is about completed and comprises eight new buildings, erected after plains of the Michelin branch factory in Italy. The plant is located on an 80 acre tract purchased from the International Auto & Vehicle Tire Co., but the buildings used by the International Company are not to be used for manufacturing purposes, only as storehouses and offices. The completed plant will have 8½ acres of floor space and the machinery will be operated by means of two 1000 K. W. turbines made by the Westinghouse Company, and developing 2440 horse-power. An auxiliary 700 H. P. plant is also installed.

It is Michelin's intention to establish branches in all the important cities in the United States, where large stocks will be carried, thus enabling the trade to get prompt deliveries at all times. Michelin will supply quick detachable, as well as clincher tires. The detachable tires can be used on any of the well known American quick detachable rims. In addition the Michelin demountable rim and tires will be made in American sizes. This demountable rim is the one which has been used in all the great racing events of 1907. With it has been used the Michelin anti-skid, leather tread, steel studded tire.

The Ritter Mfg. Co., manufacturers of automobile bodies, cushions, trimmings, etc., has recently moved into larger quarters at 63-69 Amsterdam St., Detroit, Mich.

The Royal Rear Light Alarm

The Royal Battery Company, of 10
Duane street, New York City, has jus
placed on the market a new specialty i
the form of an alarm device which i
stantly warns the driver when the electri
tail light goes out for any reason. Th
outfit consists of an electric tail ligh
operated from the ignition battery an
a signal device (a bell or whistle), whic
is also operated from the battery as soo
as the light goes out. If the bulb shake
loose and thus loses contact with the cu
rent wires, or if the wires become de
tached for any reason the current is i
stantly shunted to the bell or the whistl
and the alarm given. An option is give
in the alarm device, as some prefer
whistle to a bell. This alarm sounds als
when the battery current gets too low t
maintain the light.

The 1908 "Hill" Wind Shield

In addition to its well known line o
automobile tops, bodies and seats, the Hi
Mfg. Co., 25-27 Fuller street, Buffalo, N. Y
has recently placed a new folding win
shield on the market for 1908.

This shield folds directly in half. Th
rods are of brass tubing, with solid bras
castings on each end, making very stron
stay rods, yet light in weight. The bo
that takes the stay rod at the top is ca
solid on the hinge fixture, and the hing
and bolt taking the stay rods are both o
one casting. The frame is of dar
mahogany and is fitted with heavy polishe
plate glass. All of the fixtures are o
polished brass.

e cellular.

The feature of this tire is its peculiar m construction, which consists of mould- g the rim with holes all the way round. he holes are mouldered on a slant to oid picking up gravel stones. The tire

The "Swinehart" Cellular Tire.

practically self-inflating as the holes ose in contact with the road surface st before the tire compresses under load. he same cross wire system of fastening clincher rims as used in the Swinhart lid motor car tire is also used in this re. The price is the same as for the vinehart concave.

The 1908 Healy Leather Tire

The Healy leather tire made by the ealy Leather Tire Co., 88-90 Gold street, ew York City, is a distinct improvement er last season's model

steel, thoroly tempered. These are only tool steel rivets, we know of m for auto purposes, and the Healy Leat Tire Co., claims to control all rights the same. All the other features of 1907 model are retained.

The Rushmore 1908 Lamps an Generators

The Rushmore Dynamo Works, South Ave., Plainfield, N. J., has m no material change in its lamps and g erators for 1908 and no change whate in exterior appearances. The only cha in the searchlight is the use of a dee and shorter focus lens mirror which made of a composition which this c pany has lately discovered and which wonderful heat resisting properties well as great mechanical strength.

The Rushmore Company is also o ing the 1908 automobile trade the Ru more high power marine type projec in suitable form for use on high powe runabouts. This lamp has come into tensive use on Western railroads and said to be a very powerful light produ suitable for use on these fast runabout

The 1908 Rushmore Generator has been changed materially, but the shak grate has been improved so as to eli nate a little difficulty which has been perienced heretofore.

The "King" No. 2 Gogglette

Julius King Optical Co., 2 Maiden La New York, has brought out a new mo of the "Gogglette" which is here il trated. In the Gogglette No. 2, the cups are made of aluminum and are ceedingly light. The cups are fitted w inflated rubber cushions, which make th fit snugly around the eyes, protecting eye from insects and foreign partic

The "King" No. 2 Gogglette.

It is so arranged that white, amber smoke lenses can be used; the chang of lenses being only a moment's wo Lenses ground to suit the eyes of wearer can also be easily inserted.

The "Gemmer" 1908 Standard Gear

The Gemmer Mfg. Co., Detroit, Mich., is ready with its 1908 steering gear which has been thoroly improved and refined thruout.

Referring to the cut the adjusting nut K, has been lengthened to provide a very long bearing for the main nut I, which is brazed to the column of the gear. The rocker blocks G, which take care of the angular lateral movement of the rocker bearing are dove-tailed into the nuts D and E, so that it is impossible for them

The "Gemmer" 1908 Standard Gear.

to get out of place. The balls of the ball thrust J are held in a retainer. The bearings thruout are ground very accurately to size, there being practically no lathe finish on the gear. The threads are all perfectly formed on special automatic threading machines, and are case hardened and carefully ground before being assembled.

Special high grade steel is used in the construction of the 1908 gear. The lubrication has also been perfected thru the addition of oil cups and grooves.

The Gemmer Co. is now located in its new factory, planned especially for production of work of this kind. The concern has a foundry of its own for the production of steel castings, which enables it to give prompt service on rush orders and also insures it against being held up for material. Every part of the gear is finished in the Gemmer's own factory which has a capacity of at least 10,000 steering gears per year.

The "Auto" Foot Rail

In addition to the automobile robe rail described in our June, 1907 issue, page 184, the Auto Rail & Equipment Co., 113 Michigan Trust Building, Grand Rapids, Mich., are offering an improved folding foot rail to the trade.

The "Auto" Foot Rail.

The feature of this foot rail consists of two solid cast collars brazed to the tubing to prevent the side slipping of the feet of the occupants of the tonneau. When the rail is not in use it can be swung back out of the way.

Miller's New Lubricants

Wm. P. Miller's Sons, Long Island City, New York, are including in their 1908 line of automobile lubricants a new oil called "Excelsior Fiberous Oil." This is a solidified mineral oil of fiberous nature which causes it to cling to bearings and gears to which it is applied, forming an excellent friction allaying surface. The manufacturers claim this oil will not change in consistency because of temperature changes, and will therefore, not drip from bearings or gear cases. Excelsior Fiberous Oil is furnished in three different consistencies—2X being recommended for sliding gear transmissions; 3X for ball and roller bearings and for planetary and differential gears; and 4X for compression cups or for bearings and gears, that require a lubricant with a very heavy body.

This concern is also now putting out a cylinder oil, especially prepared for Packard cars, which is of course suitable for any use where a light oil is desired. This special oil for the Packard is called "Excelsior Pale Light Gas Engine Cylinder Oil."

The Delta Mfg. Co., Bloomfield, N. J., is now putting up each "Delta" spark plug in a round, metal-bound cardboard box with metal screw top, this box prevents damage to the plug while knocking around in the tool box or in the store before being sold.

ng the automobile trade a form of multi-le disk clutch which has some new feat-res that have by actual test proved of reat value, eliminating, they say, all ob-ections to the disk clutch. The principal eature of this clutch is the circumferen-ial corrugation of the plates which forms ircumferential wedge grooves that pro-ide the frictional area when the disks re in engagement. These grooves also dd greatly to the strength of the disks, fact well known and applied in the man-facture of tin can ends. On account of he angular form of the engaging surface t is claimed that much less pressure is re-uired to apply this clutch than one of the lat disk type, and a very slight pedal ressure suffices to disengage it.

It is also claimed that as the engage-nent of these clutch plates is in the rooves only, the greater part of the late is separated from adjoining plates ufficiently to allow a free circulation of ubricant. Holes are provided in the cor-ugated surface of the disk to permit the ree flow of oil onto the engaging urfaces, and prevent the generation of ndue heat.

This form of clutch has been well tried ut in England, and is said to have proved mooth in action and gentle in picking up ts load.

Powell Evans, president and the active pirit of the Merchant & Evans Co., has reatly improved the English pattern of his clutch, and the type that is now of-ered the American trade is even more fficient than the original Hele-Shaw clutch.

Mr. Evans has also developed a new hange speed gear for motor cars, and a tion with the "Hele-Shaw" clutch ma superior driving unit for automobile w

The company will also market the "S Metal Tire Case, also designed by Evans, in which simplicity, appeara strength, lightness and comparatively cost are features.

He is also importing steel, having in various trips abroad made a deep thoro study of the sources of suppl automobile parts in their rough finished forms. He has negotiated the producers from the foundry up of best known steel products employed the leading foreign makers of cars.

Merchant & Evans Co., therefore, in inquiries for the entire range of grade foreign steels, needed for the automobile construction for every for gear and shaft forging and drop for either rough or finished exactly to pl likewise for chassis, front and rear a of every form.

Their foreign connections have pl offices and warehouses established in land and France, where these purch will be made to the same advantage the home constructors in these coun make them, inspected on the ground shipt direct to this firm for distribu here.

The 1908 Nathan line also includes ner tube bags, grease bags, storm cove automobile covers and trunks of vario shapes and sizes. The tire covers a other fabric specialties are furnished various colors to match the upholstery different cars.

The "India" Automobile Oil Stone

This is an oil stone put up specially f the automobilist's use by the Morton C Worcester, Mass., an marketed by t Pike Mfg. Co., Pike, N. H.

This stone is to take the place of t file so often used for filing the ends the contact points. It is well known th with the use of a fill the result is th the contact points are usually left in rough state, thereby causing addition "pitting" instead of preventing it, a also wasting too much platinum. Wi the use of this stone the contact poin are left in a smooth and polished con tion thereby giving a very smooth co tact. The stone can also be used f sharpening pocket knives and any sm edge tools. The price of this stone is cents; in a handsome leather case cents.

Hosted by Google

ber of interesting improvements, the main feature of the battery lying in the arrangement of the plates, which is such as to eliminate all lead burning.

The construction of the positive plate is of such a nature that it delivers a very high capacity and maintains it almost to the life limit. It is made from a sheet of pure lead, which is "spun" out into ribs increasing the surface of the original lead blank twenty times. A coating is formed on the surface of these "ribs" by an electro-chemical process.

The material which might be said to store the electricity does not fall away to any extent, and whatever loss does occur is made up from the pure lead by means of recharging the battery, thereby keeping the output of the battery nearly the same thruout its life.

Latest "Wico" Products

The Witherbee Igniter Co., 541 West Forty-third street, New York, has brought out for the 1908 season a number of new products all of which are marketed under the trade name Wico.

The Wico compact trouble lamp con- new departure in the roller type of timer. A loose ring is provided which at all times allows a perfectly smooth path of the roller and exposes a constantly chang-

These wheels are furnished in differe
styles to meet the requirements of va
ous car makers; some with solid rin

"Warner" 1908 Products

The Warner Gear Co., of Muncie, Ind., is offering for 1908 a new transmission, gear set and steering gear.

The transmission which is of the selective type is shown herewith in section. The driving shaft is splined and is mounted

The "Warner" 1908 Selective Sliding Gear Transmission.

over the counter shaft, which makes it easily accessible. The transmission is made for all standard widths of frames.

Special attention is called to the method by which the Warner gear set is operated.

The "Warner" 1908 Gear Shift Set.

Fingers operated by a coil spring are mounted into each sub-lever, which in turn is controlled by a hand lever. Either shifting tube can be operated independently of the other. It will be noted that there is no plunger to be operated except when the reverse is wanted. At that time only is the plunger operated by the thumb which throws a little dog, usually known as a "lock out" or reverse.

The Warner 1908 steering gear is of the worm and sector type, the sector being of the continuous ring pattern. Both sector and worm are hardened and ground to a perfect fit. The worm is adjustable and is equipt with ball thrust bearings. The sector is also adjustable into the worm. This steering gear is furnished in both touring car and runabout types. The

The "Warner" 1908 Steering Gear.

spark and throttle control is mounted on top of the wheel, running to bevel gears underneath the steering check to vertical control levers, leading to carburetor and spark control. The Warner Co. is equipping these steering gears with friction control levers in the wheel, which is a novelty of this season.

Trenton Brake Lining

Trenton Rubber Mfg. Co., of Trenton, N. J., have placed on the market a new kind of lining for automobile brakes, and similar frictional service. This lining is claimed to possess three very important advantages, namely: It will not absorb oil or water, and will not burn; and that it grips instantly while it wears indefinitely. It consists of a combination of specially prepared rubber with fine strands of brass wire woven into it, and this combination is said to give not only the necessary strength but the required resiliency. Quite a number of car manufacturers have lately given this material a thoro trial with pleasing results. The material is sold at a price per pound which makes the cost of the material used in equipping a set of brakes a very small item.

ley Mfg. Co., 607-609 Fort Street, West oit, Mich., has placed on the market 908 a new autochime called the "Mid- " a combination autochime, cut-out safety relief valve, and a combination chime cut-out pedal.

"Gray-Hawley" Combination Autochime Cut-Out Pedal.

e Midget autochime is especially de- ed for small launches, and can also sed on motor cycles. It is blown by exhaust. On account of its internal truction, it has a very low pitched cal tone. The Midget measures 5 inches.

e combination autochime, cut-out and y relief valve is placed on the ex- t pipe close to the engine. The left ear lever operates the autochime, h is attached to the threaded boss.

"Gray-Hawley" Combination Autochime, ut and Safety Relief Valve.

right or forward lever operates the ut. The bracket, lever and tension adjustable.

special description of the combina- autochime and cut-out pedal is neces- as the accompanying cut shows the

ing for 1908 two new lines of chains in addition to their well known standard types and sizes. The first is distinguished by the use of chrome nickel steel for the side bars, which gives the chain high tensile strength and great elasticity.

The other known as the "built-up block chain" is specially adapted for medium and slow speeds and under heavy loads. This chain is similar in appearance to the roller chain, but the roller and bushing are supplanted by a hardened bushing of

"Diamond" Chrome-Nickle Steel Chain No. 170

outside diameter equal to that of the roller. The absence of the roller permits the rivet to be made very large in proportion to the pitch of the chain. The added bearing surface thus secured, makes the chain practical where a roller chain of the next larger pitch would be required. The built up block chain therefore effects a saving over the roller chain in cost and weight of chain, and in size, weight and cost of sprockets for the same duty and speed ratio.

renheit and release the gas. As
nary combustion does not commence
a temperature of 286 degrees Fahren-
is reached, the gas would, in case of
be released and out of the tank long
re there could be any danger of igni-
Acetylene gas will not explode in a
perature under 1,400 degrees Fahren-
Thus, all danger from accidents is
away with. The gas in the tank is
r condensed to a pressure exceeding
tenth of what the walls of the tank
built to withstand.

here are three things that will prevent
Prest-O-Lite tank from working per-
y. The first is: The valve of the
tate opening the valve more and more
order to keep the lights burning. Thir
gas tanks should invariably be "r
charged" by the concern possessing th
required knowledge and experience.

RECHARGING.

Before recharging "Prest-O-Lite" tank
each cylinder is first numbered, packe
with asbestos wool and weighed. A co
rect record of numbers and weights
kept, and a copy is sent to each of th
company's pumping station. A certai
amount of acetone is put into each cylinde
and charged with acetylene gas. The cy
inder is then packed in ice and left the
for three hours. It is then taken out an
the pressure again applied, which add
about ten additional cubic feet to the ga
already in the cylinder which is packed i
ice a second and third time, after whic
it is ready for delivery.

When a tank is empty and ready for r
charge it is necessary to weigh it, in orde
to determine whether or not it contain
the proper amount of acetone. If it
found to be below the required weigh
sufficient acetone is put into the tank t
bring it up to the necessary weight

made with the odometer enclosed and furnished in two models, one registerin up to 60 miles per hour, list price $4 and the other registering up to 90 mile per hour, list price $75. All three model have 5-inch dials and are operated, as be fore, by centrifugal force. The over-a diameter of the these instruments 4½-inch, and the depth is 2½. The are finished in highly polished brass Scales are evenly divided making readin easy. The flexible shaft used in connec tion with the Stewart speedometer con prises a core consisting of a number o file hard units hooked together into chain. This core revolves in a tub formed by coiling a flat hardened an tempered steel ribbon, the inside surfac of which presents a hard smooth bearin for the core. The core and ribbon ar finally enclosed with a protecting casin of brass, which is also highly ornamenta It is said that this construction avoid binding in the shaft and all tendency to ward crystalization when the shaft is as sembled. It is filled with lubricant con posed of graphite and cosmoline an sufficient quantity for one year's con tinuous use being put in.

"C. O. T." Gum Gum

C. O. Tingley & Co., Rahway, N. J have just placed on the market a new preparation called "C. O. T. Gum Gum for filling cuts in the outer shoes of auto mobile tires. It is said to perfectly hea any cut and thus prevent the entrance o water, sand, etc., to cause damage to th tire. It can be applied instantly, and drie in a few minutes, requiring no vulcaniza tion. Where a cut goes all the way thr it is of course necessary to first place backing of canvas on the inside of th shoe. It is put up in 3-oz. tubes, listin at 50 cents each.

The "Columbus" Steering Gear

The Columbus Screw and Machine Co., 244 Kaiser street, Columbus, Ohio, manufacturers of the Columbus automobile and motor boat engines have recently brought out a new steering gear, which on account of its improved construction is expected to eliminate the end wear on the worm and housing.

The wear is overcome by putting in ball thrust bearings, running between hardened plates. The worm and gear are both of hardened steel and the wear on these is almost nothing, but adjustments are provided in case any wear does occur. The worm gear which is integral with the shaft is provided with eccentric bronze bushings and the thrust on both the worm and gear is taken up by the plug nut shown. The plug is held in place by a locking device that allows the very slightest turn of the adjusting nuts, and is a positive lock. All the worm gears are furnished with 20 teeth and the worm with either 4 or 5 teeth. Either a 6 or 9-inch arm is furnished.

Two sectional views of the new "Columbus" steering gear, plainly showing the ball bearings to take the end wear on the worm and housing.

The post is made of Shelby tubing 1-inch in diameter and ¼-inch thick with the quadrant tube running thru this and locking on the housing at the bottom.

The control tubes and rod for throttle and spark run thru these and are furnished with bell cranks at the bottom.

The fastening plate is made in such shape that the gear can be fastened at any angle to the sub-frame of any standard car, or if ordered in quantities of a hundred or more, the fastening plate will be made to suit the purchaser. The list price of the gear complete is $25.00; for check only, $12.50. A discount is given when ordered in quantities.

The 1908 "Powell" Prest Steel Muffler

The Powell Muffler and Timer Co,. Inc., 42 La Fayette street, Utica, N. Y., is continuing the manufacture of the Powell prest steel muffler for the 1908 season without material change in its construction from the former model described in our January, 1906 issue, page 372, at which time only an outside view of the muffler was shown.

We are now able to give a view of its interior, showing the peculiar construction of its baffle plates. The shell of the muffler consists of a succession of prest steel cups drawn from sheet metal, of No. 16 gage. Each cup is shouldered so that it overlaps the bottom of the succeeding one by one-fourth of an inch; the number of cups used varying with the size of the engine to be muffled.

The 1908 "Powell" Prest Steel Muffler.

These cups are held together by three tie rods made of 5-16 inch steel, and surrounded thru the center with iron pipe to protect and strengthen them. The perforations of the baffling plate are around the outer edge of each one with an additional one in the center of the first few. The area of these holes vary with the size of the engine to be muffled. The mufflers are made with from 10 to 16 sections, listing at $5.00 to $8.00.

Every dealer, every owner, every maker of cars wants to know of all the new features of all the new cars and the source from which to obtain this information in the most concise and readable form is the Cycle & Automobile Trade Journal, published at Forty-ninth and Market streets, Philadelphia; 1908 models are being described in every issue; the first 1908 description appeared in the June issue. To enable new subscribers to obtain descriptions of all the 1908 cars we offer to start subscriptions with the June number if the $2 for a year's subscription is received before our stock of back numbers is exhausted.

"Martin" Fuel Strainer

A new automobile specialty, the Martin gasoline strainer, has recently been placed on the market by the Turner Brass Works, now at Sycamore, Ill.

The "Martin" Fuel Strainer, exterior and sectional views.

The object of the Martin fuel strainer is to furnish pure, clean gasoline to the carburetor. It is constructed with a chamois bag, which separates the water from the gasoline the water falling to the bottom with other foreign substances, where it may be drawn off thru a pet cock provided for that purpose. The device is so arranged that the vibration of the car keeps the filter or chamois bag striking against the sides of the tube, thereby dislodging the foreign substance and keeping the chamois free, thus giving the full filtering surface and preventing it from clogging.

Improvements in the Delta Spark Plug and Dry Cells

A few improvements have been made in the Delta spark plug and dry cell manufactured by the Delta Mfg. Co., Bloomfield, N. J., the newest feature in the spark plug being the use of special alloy wire for both sparking points, instead of the center spindle being all steel as formerly. The spark plug is made in half-inch, metric and the new A. L. A. M. standard threads, and is sold in a round metal bound heavy cardboard box with metal screw top, the advantages of the box being that it protects the plug from being broken or the

und necessary in the "Neverout" Gas oducer for 1908, and the several changes at appear in the new model, while im- rtant and valuable improvements, are t refinements of details designed to ren- r the device more thoroly immune from mage by careless handling. The original incipal of invertibility for the purpose

pe 8 "Neverout" Gas Producer, Single Chamber Style.

bringing the carbide into contact with e water; or to break the contact between e dry carbide and the wet ashes when more gas is wanted, has been rigidly hered to in each successive model and e improvements made from year to year ve been chiefly in the nature of added fe-guards and strengthening of parts ble to careless handling.

Probably the most important improve- ent in type 8, is the change in the gas rifying system. In the 1907 model the

pe 8 "Neverout" Gas Producer, Double Chamber Style.

rifier was in the form of a sack shaped ass receptacle at the side of the pro- cer, but in the 1908 model the gas vels down a tube at one side, thru a rizontal tube at the bottom and up thru

able, is an extension on the framew of the device which makes it impossi to turn the producer too far in eit direction. A similar feature prevents clamping handle from denting the sta ard at that side. The handle is also m compactly placed and does not extend yond the line of the producer proper.

Besides the U. S. and European pate that have been allowed on this device makers, Rose Mfg. Co., 911 Arch str Philadelphia, have also been gran patents in Asiatic countries includ Japan.

Open Pattern "Indestructible" Steel Wheel

The Indestructible Steel Wheel Co., 1 Michigan avenue, Chicago, now has the marker a special type of its all-st automobile wheel, this new type, cal the "open" pattern being designed es cially for pleasure cars.

The New Open Pattern "Indesctructible" s wheel used on a Premier car in which Mes Fish and Metzel toured thru Indiana, Ohio Michigan, demonstrating the wheel.

The open pattern wheels makes a fi appearance and is transparent when motion. This feature places it in succes ful competition with wood wheels, maki it a welcome offering to the automob trade.

Messrs. Fish and Metzel, the preside and vice-president of the Indestructib Steel Wheel Co., recently made a demo strating trip thru Indiana, Ohio a Michigan in a Premier Roadster, fitt with these open pattern "Indestructibl steel wheels, and visited various aut mobile factories in those states. T engineers, superintendents and purchasi agents in these factories showed great i terest in the wheel, and studied i mechanical points intently. Many fa tories placed orders for these wheels f their 1908 output.

Are you desirous of reading descriptio of all 1908 cars on the market? If so su scribe for the "Journal," for it contai more technical descriptive matter relati to 1908 cars than any other publication its kind. About 60 1908 cars have be described and if new subscribers desi to commence their subscriptions with t June number, which contained the fi

Atwater Kent Spark Generator

Praised By The

ELMORE MFG. CO.

Taken from the Philadelphia Record of Oct. 6th, 1907.

NO IGNITION TROUBLES

Elmore Company Announce Remarkable Improvement.

Absolutely and unquestionably one of the most remarkable improvements that will be shown in the automobile season of 1908 is the ignition system of the new Elmore valveless two-cycle cars. After a series of the most exhaustive tests, both by the factory and by purchasers who have reported to the factory, the Elmore Manufacturing Company, which makes the Elmore cars, has come out with the most remarkable promises and guarantees ever offered.

Their tests have convinced them—and they will verify the statement—that upon one set of six ordinary six-inch dry cells the Elmore car will run more than 1500 miles, and that it has done over 2000. This sounds somewhat stupendous, but the name and reputation of the Elmore Manufacturing Company is absolutely back of it. In fact, were the truth told, even greater figures than those can be cited and proved to be the rule.

This means that with the new system an average season's driving can be accomplished on two sets or a dozen six-inch dry cells, with which every Elmore is equipped. Not only that, but the system is so sensitive that it has been known to work for many, many hours on a set of batteries thrown away as exhausted. In fact, the operation has been performed till the cells were drained down to one ampere.

This new ignition system absolutely does away with timer troubles, with vibrator coil worries and with depleted, shortened or run-down storage cells. All these things so bothersome are banished and perfection is almost, if not quite, reached. Because of the success of this new ignition system and because of the proven value and success of the two-cycle idea in their new cars, the Elmore people in the most unobtrusive manner are proclaiming their car for 1908 "the most perfect car of its class in the world."

The above refers to the ATWATER KENT SPARK GENERATOR which the Elmore Mfg. Co., have adopted for their 1908 output.

Our Spark Generator gave such entire satisfaction on Thomas Flyers in 1907 that the E. R. Thomas Motor Co. will again use them for 1908.

"Once used, Always used."

New Models—New Prices

We now announce the completion of tools and equipment for producing the Improved 1908 Stewart Speedometer (with enclosed Odometer)—absolutely the most perfect Speedometer ever turned out of any factory, American or Foreign. Every feature and function of this truly splendid instrument has been brought to such a stage of perfection that all former efforts in Speedometer manufacture have been completely outclassed.

Our plan to make the best possible Speedometer, regardless of price, and sell it at a lower price than any other make, enables us to announce a change of price in Model No. 4, our 60-mile instrument, heretofore sold at $60. New price, $40.

$40

No. 4 Stewart Combination Speedometer-Odometer, 4-inch dial, 60-mile **$40**

No. 5 Stewart Combination Speedometer-Odometer, 4-inch dial, 90-mile **$75**

Covered by Our Ironclad Guarantee

A NEW SPEEDOMETER

The American

A low priced Speedometer of quality, exceedingly well made. A simple mechanism positively accurate within 50-mile limit permits us to sell THE AMERICAN at a price astoundingly low. This is a high-class instrument, suitable for all cars that do not require a Speedometer capable of indicating a greater speed than 50 miles.

GIBNEY TIRES

GIBNEY TIRES

Announcement

to the Owners of Commercial and Pleasure Vehicles:

AFTER many years of close study and intimate knowledge of European and American tire manufacturing processes, we take pleasure in presenting herewith two tires of our own creation.

Years of research enable us to assure the public that in the new products we have not only embodied the best features for the old and new world, but have secured resiliency and durability to a degree equaled by no other solid tire yet constructed.

GIBNEY

Solid Tire and Sidewire Endless Motor Tire

are made of purest Para rubber with minutest care by selected workmen of the highest grade, under the direction of expert chemists.

As our name in the past has stood for the "square deal" so our trade mark in the future will be synonymous with all that the term implies.

1908 "Ross" Steering Gears and Universal Joints

The Ross Gear & Tool Co., Lafayette, Indiana, are offering for 1908 three types of steering gears, viz: tubular, spiral and disc, the same being herewith illustrated. They also make an improved form of universal joint.

The tubular gear Type BA, was designed with the idea of producing a steering gear that would work in any position or angle; that would be very small, yet very strong and durable; that at the same time would have contact surfaces so large and ample that the wear would be reduced to a minimum; that would not wear in the mid

The 1908 "Ross" Tubular Steering Gear; Type BA.

position and bind in the extreme position if the wear in the mid position was taken up. It is constructed to meet the demands of truck and touring car construction, where the back-lock should be absolute.

The steering gear may be fastened to any car by bolting thru the plate, shown on the side of the housing, and thru the chassis or sub-frame.

As the drawing shows the steering arm has the side-wise motion. It can be put on the square end of the shaft shown, where the controls are desired thru the column, or it can be made all in one piece with the shaft, which in that instance would be solid and the controls would be placed on the outside. The internal con-

The 1908 "Ross" Spiral Steering Gear; Type BB.

trols are operated in a notched sector on top of the wheel. The sector does not rotate. To meet the demand for a gear of this type for use on cars of light construction, they have designed type BC. It has the same advantages of the large wearing surfaces, absolute back-lock, etc., that the BA type has. It is absolutely dust-proof and oil-tight. The controls are fastened on the outside of the column.

Type BB, has the same advantages of the tubular construction, but has the fore and aft motion of the arm. In this design the back-lock is obtained by making the spirals on the housing with 16 2-3-inch lead so that all the road jar is taken up by the spirals and no shock is transmitted to the pinion. Therefore, the only force acting on the pinion is the effort to steer the car.

The wearing surfaces are so large that no lost motion is devolped in the wheel. The control levers for spark and gas are placed inside the column, and are operated on a notched sector on top of the wheel. This sector does not rotate. In the cut, two plates are shown on the horizontal part of the housing. The plates can be used for bolting the steering gear on the chassis when the main frame and the sub-frame are on the same level. When this

The 1908 "Ross" Disc Steering Gear; Type BD.

is not the case, the plate is cast on either side of the upright part of the housing, so that the steering gear may be bolted either to the sub-frame or to the main frame as desired.

The disk type BD is a departure from all of the general designs of building steering gears. The motion of the arm is obtained by rotating the inclined disk on the shaft and enveloping this disk by the extended portion of the arm. This gives a large wearing surface and very little wear is developed. However, as a slight wear is magnified on the rim of the wheel, ample means have been provided for taking up any lost motion which might develop. One side of the envelope, surrounding the disk, is threaded and may be tightened very

Hosted by Google

ar is keyed to the horizontal shaft with ır key-ways, so that it may be turned ru a quadrant if it develops any lost otion. The smaller gear may be turned a new wearing surface by throwing the ars out of mesh and turning the wheel.

The 1908 "Ross" Universal Joint.

This steering gear is designed for run-outs and cars of light construction. Inal column controls for spark and gas furnished with this type. The control ers are operated in a notched sector on of the wheel. This sector does not ate.

The universal joint shown herewith is de in four sizes to suit different shaft meters. The joints are very easily dissembled and are oil-tight and dust-proof.

The "Colonial" Suspension

Colonial Spring Suspension Co., Newark, J., has just placed on the market a new e of spring suspension or shock abbing device which is being sold at a sonable price.

The "Breech-Block" Plug

No ordinary plug, with fixed spark gap, can be tested for leakage or breakage without removing the porcelain. To lay a plug on the engine and pass the spark is a foolish formality. It shows nothing and means nothing as far as testing the plug is concerned. A fouled plug with a broken insulator is a fine sparker outside the engine—but a dead one under compression.

With the "Breech-Block" it's different and simple. You have the intense satisfaction of instantly knowing whether or not your plu s are in perfect condition. To test, pick them out, one by one without removin z the wire, (T kes same time and effort as to pick out your watch) hold by the handle with the sparking point close to the shell, (See picture above) turn on the current and gradually increase the length of the spark to one half inch. If no shock comes from the handle, the plug is in p rfect condition. You know it. No guess work.

To clean, pick out and wipe off with one twist to instant whiteness. Drop back. Time: 4 seconds.

The chambered end of the "Breech-Block" is incomparably better than the open end type with projecting wire points. It protects the porcelain and keeps fragments out of the cylinder. The rapid movement of gas through the spark opening keeps the points clean. No amount of oil can cause skipping.

The chambered end also brings the spark deep down into the mixture and makes the engine run sweetly when throttled down to the limit.

For cold weather starting, this chambered end is invaluable. Simply open the breech and squirt gasoline into each of the nipples which settles down into the chamber **around the sparking points** and the first quarter turn of a stiff cold engine starts her off.

After each run, pick out each breech and pour in a spoonful of kerosene while the engine is hot and on the next start she will just dance on compression and not be stiff and sluggish but lively.

If you carry an extra plug with you, you can replace a questionable plug without stopping the engine.

All dealers carry all threads.

Write for booklet.

eter lists at $3.50, for an instrument
eading up to 3 v. and 30 amps; and $4.00
r a 10 v. 30 amp., or a 12 v. 30 amp.
eter.

Keystone" Crucible Steel Automobile Castings

The Keystone Steel Casting Co., of
hester, Pa., are making a specialty of
ucible steel castings for automobile con-
ruction. A grade of crucible steel cast-
gs for automobile parts is furnished,
hich, it is claimed, is not only exception-
ly clean so that it requires but little
nishing after casting, but the metal is
niformly sound, will withstand the sever-
t tests as to bending and welding, and
ill also machine readily to a fine finish.

The facilities of the company are such
s to enable it to make very prompt de-
veries, and include the quickest-acting

features in his latest type spark coil,
most notable being the manner
mounting the coil so as to make it
solutely water-proof to resist rain
spray. It is claimed that water may
poured in the outside box without in
fering with the action of the units.

A slight change has also been made
the vibrator, making it much more ra
and efficient. The switch has also b
changed and is built on the knife swi
principle, which it is claimed makes

vements add to the efficiency and rability of the 1908 model. This speed icator is the product of Warner Inument Co., Beloit, Wis., and has comed with the speed indicating mechan, an odometer for recording mileage, is usual in this class of instruments.

ctional View 1908 Warner "Auto-Meter"

ne of the chief improvements in the 8 instrument is in the odomoter drive, pecial arrangement being now employed ch prevents derangement of the speed cating mechanism in case the odoer gets out of order.

he Auto-Meter is driven by a flexible ft, and the general construction of this ft is not changed in the 1908 model, it has been improved by having both s fitted with swivel connections and partially covering the shaft with a hand ed leather casing that prevents chafing oth the shaft and car.

he bearing has also been improved by pping it with spiral hardened gears. s bearing also connects with the shaft neans of a swivel joint so that, regard- of sharp turns of the steering knuckle he car, the shaft always hangs in a and easy position.

he construction of the flexible shaft e is made clear by the accompanying trations, showing a sectional view of shaft and drive and a detailed view he shaft and its sheath. In the latter "A" is the swivel nut; "B," a rercing casing; "C," the flexible brass ng, and "D" the shaft itself. The shaft nade of links, a flat link alternating a round link. The round links are ed at each end to admit the flat links.

all strain. The Warner company clai to have one of these shafts running co tinuously in its factory, and the shaft ha at last report, run the equivalent 160,000 miles without showing sign wear. The swivel nut (A) at the upp end of the brass casing screws into t speed head of the instrument and mak it easy to attach the shaft to the instr ment without twisting the casing.

The Auto-Meter is, we believe, the on speed indicating device operated on t principle of magnetic force, and th feature is patented by the Warner Co pany. In the sectional view herewith t magnet which is the operating force designated by the letter "C." The lin of force flow from the north pole of t magnet thru the aluminum dial "G" the field ring "D" located just above t disc of the dial, then back again to t south pole of the magnet.

The tendency of the magnet when r volving is to rotate the dial in the dire tion of its own revolution. This rotatio of the dial is in proportion to the spe of the magnet. A hairspring acts as drag on the dial, always having a te dency to bring it back to the zero poi The strength of this hairspring increas directly in proportion to angle of displac

ment or turning of the dial, with the speed

"Isn't it Great?"

The Great Smith four-cylinder touring car for 1908 is just as dependable as ever, it looks just as good, and it behaves just as well. These are the big things that count. Then come the little things, and this is where we have made improvements that have mat ased the general efficiency of our 1908 model.

The addition of roller bearings on the auxiliary shaft makes far less noise and more power. The tonneau door has been made two , and a quadrant has been placed over the steering wheel giving better control of the throttle and spark levers.

The simplicity of the magnetic principle is its most admirable quality. The magnet acts directly upon the indicating dial. There are no intermediaries whatever between the two; nothing to wear out and cause inaccuracy.

The speed dial of the Auto-Meter rides in genuine sapphire jewel bearings (J and K). The pivot that carries the dial is made of high grade imported steel, and each end of the pivot rides in two jewels, one set of them (J, J) being hole jewels, and the other set (K, K) being cap jewels. The pivot ends are ground and lapt with diamond dust to a perfect fit in the jewels.

The hairspring is more durable than those used in the best made watches, altho it is required to do but a small fraction of what the watch spring must perform, the Auto-Meter hairspring making a complete movement only when the speed indicating dial travels a full revolution, which is only when a speed of 60 or 100 miles per hour is attained, a rare occurrence.

Universal fittings are not furnished with the Warner instrument, as the makers do not believe in the practicability of such fittings. They furnish special fittings for each make of car, which are guaranteed to fit without expert labor being employed. Other features of the Warner Auto-Meter have been fully described in past issues of the Journal, and are retained in the 1908 model. The device has not been altered in general appearance and hence no exterior view is here given.

The "Fouch" Disk Wheel

The Fouch Steel Disk Wheel Co., No. 11 Tribune Building, Minneapolis, Minn., is placing on the market a new automobile wheel of the disk type. This wheel consists of two main parts of sheet steel, each

The "Fouch" Steel Disk Wheel, broadside view. The spokes are painted on the steel disk in color to match car, and the intervening spaces are painted aluminum, the effect being same as a spoked wheel.

part comprising practically one-half the wheel, including the spokes and rim, the hub, which is of malleable iron, being separate. The two disk portions are held together by six bolts and nuts at the rim, and one large nut at the hub. The hub is made to fit any axle or bearing.

The spokes are painted to match the car finish and the spaces between the spokes are the color of aluminum, so that at a distance of ten feet the "Fouch" wheel cannot be distinguished from an ordinary wood wheel.

The valve stem protrudes in practically the same manner as on a wood wheel, and there is thus no need for providing a door in the wheel disk to allow access to the valve. The special construction that permits this feature is covered by patent.

The "Fouch" Disk Wheel, Disassembled.

This type of wheel while combining the advantages of lightness and strength is also very easily cleaned, a feature of great practical value. The quickness and ease with which the tire can be removed is another advantage. This is accomplished by removing the nuts above referred to. This allows the disks to separate, thus freeing the tire. The inner tube can be replaced and locked between the disks without danger of pinching the same, and it is claimed that this operation can be performed by an inexperienced person in three minutes.

Ham 1908 Lamps

C. T. Ham Mfg. Co., Rochester, N. Y., announces that it has made no radical changes in its cold blast lamps for 1908, its policy having always been to avoid extremes in design and to stick to the construction principles that have proved satisfactory. The slight changes made in Ham lamps for 1908 are merely a "dressing up" to make them more handsome than they were last year.

In a news note in our October issue we mistakenly stated that A. R. Davis is secretary and general manager of the Garford Company. He fills these offices with the Garford Motor Car Company, of Ohio, not the Garford Company, the latter being the manufacturer and the Garford Motor Car Company, the distributor of the Garford chassis.

urity" Robe and Apparel Holder

s receptacle for robes and wearing el en tour is the product of the Im- Brass Manufacturing Company, 247 Jefferson street, Chicago, Ill., who it in various colors with a view of

When opening, the mouth of the bag is pivotably swung to its full telescopic adjustment, and the lugs on the toggle arms becoming engaged bring the center rod to a level with the aperture of the bag.

The "Security" Robe and Apparel Holder.

The frame is then pushed slightly backward, the elongated holes on the back end of the toggle arms allowing this, the lips on these arms becoming engaged under the lugs of the main brackets by which the device is attached to the body of the car, the receptacle is thus rigidly held open, permitting of the proper arrangement of the contents on the center rod.

In closing, the frame-work is pulled slightly forward, thereby disengaging the lugs, and the mouth collapses, pivotably carrying the center rod into and to the back of the lug, allowing the lips to fully close regardless of the quantity of its contents, thus making it absolutely dust-proof. The metal work is handsomely designed, and made of highly finished brass. Brass grasp handles are also fitted to the sides of the holder.

Separately suspended from the top front rail inside the bag are two immense pockets especially provided for carrying each several pairs of gauntlets, veils and toilet articles. On the outside directly under the flap cover is a handsomely finished portmanteau for the safe and convenient arrangement of goggle cases. The flap cover, when closed, covers nearly half the front of the case, and is secured with a padlock. The device protrudes but two and one-half inches from the body, and is constructed so that regardless of the quantity of its contents it always maintains the same symmetrical lines as the body. These holders are made in six styles, listing from $20.00 to $50.00 each.

constructed that it can be easily repaired in case of damage.

The feature of the hood they manufacture lies in the hinge construction, the side hinges being made with a lap which makes the side hinge invisible from the outside, and at the same time makes them water-proof. The center hinge on top is also water-proof, and at the same time forms a truss so that the top of the hood in the center never sags.

"Lunkenheimer" Hand, Oil and Air Pump

The Lunkenheimer Company, of Cincinnati, Ohio, has been making for some time past several types of hand, air and oil pumps for various automobile manufacturers—below are illustrated the types most generally used.

They can be attached on the dash or heel board, or some other convenient place on an automobile. The air pumps are intended for pumping air into the gasoline tank to force gasoline to the carburetor,

New Lunkenheimer Hand Oil and Air Pumps on one bracket, the air pump is on the left, and the oil pump on the right. Each pump is furnished separately if desired.

and can also be connected to an auxiliary oil tank to force oil to the oil chamber of the mechanical lubricator.

The oil pump is usually used for pumping oil into the crank case of an engine, altho it can also be used for filling the oil chamber of a mechanical lubricator from some auxiliary tank.

There has been such a demand for these pumps used together, that the Lunkenheimer Company is also marketing the two pumps mounted on one bracket.

AT LAST! The Perfect Non-Skid

THE NOISELESS S. & W.

INSIDE VIEW OF WHEEL

No More Clashing Chains

No More Broken Fenders or Fender Irons

No More Worry

THE S. & W. NON-SKIDS may be applied and removed without tools and without deflating tires. They are instantly adjusted and stay so until you take them off. The cross chains are attached to flexible steel cables which encircle the wheels at the right points. Tension on chains is regulated by an adjusting strap which secures an even adjustment all around the wheel without binding or chafing the tire. S. & W. Non-Skids will not creep. It is not necessary to have the chains tight to produce the proper result, but it is absolutely necessary not to have them too loose. Our adjustment gives the happy medium and prevents noise and extra wear on cross chains.

The "F. R. V." Gearless Differential

F. R. V. Auto Parts Co., 116 Nassau street, New York City, recently entered the field with a line of automobile parts one of which is a gearless differential, which is here illustrated in detail. This compensating device, designed to do away with the bevel and spur gear mechanisms

Fig. 1. "F. R. V." Gearless Differential in straight ahead driving position.

now in common use, consists of five parts which are designated in the accompanying drawings by the letters A, B, C, D and E.

A and B are the two halves of the case that carries the bevel gear, and are held

Fig. 2. "F. R. V." Gearless Differential in reverse position.

together by the bolts that fasten the gear to the case. C and D are the two driven members in the case carrying similar ratchets on their faces which engage those on the case. E is a disk spring which serves to cause the members C and D to re-engage the ratchets on the case.

Fig. 1 shows this device, as designed for floating rear axle construction, in the straight ahead driving position. Fig. 2 shows the position of the parts on the reverse drive. Fig. 3 shows its action on rounding a left hand turn, from which it will be seen that the outside wheel is allowed to overrun the other.

An underlying feature of this device is the fact that it compensates for, or equalizes, distances, not resistance, and that the drive is always on the wheel that is holding its traction. This prevents incapacitation of one rear wheel, if the

Fig. 3. "F. R. V." Gearless Differential going around a left hand corner.

other is off the road, and, in such a case, instead of the free wheel spinning around at high speed while the other remains inert, the wheel on the road, with the F. R. V. differential, is the driven wheel, and the free wheel has no motion given to it. Hence the car cannot get stuck in a mud hole, or under similar conditions. It is also claimed that it is impossible to impart greater speed to one wheel than to the other, thus eliminating one of the main causes of skidding.

The Pennsylvania Auto Motor Company, of Bryn Mawr, Pa., has closed contracts for the sale of the Pennsylvania car with the following agencies: City Hall Automobile Company, 66 Fulton street, San Francisco, Cal.; The Greer-Robbins Company, 1501-1505 South Main street, Los Angeles, Cal.; The Denver Omnibus & Cab Company, Denver, Col.; The Hamilton Automobile Company, 1251 Michigan avenue, Chicago, Ill.; The Frederick E. Randall Company, 245 Columbus avenue, Boston, Mass.; The Pennsylvania Motor Car Company, Providence, R. I.; The Bellefield Motor Company, 4514-16-18 Henry street, Pittsburg, Pa.; Robert D. Jones, 409 New England Building, Kansas City, Mo.; Rice's Garage, Madison street and North avenue, Baltimore, Md.; West-Stillman Motor Car Company, 153 North Broad street, Philadelphia, and Charles F. GRAY & DAVIS

1908

LENS MIRROR SEARCHLIGHT

SQUARE OR STRAIGHT LINE EFFECT TO MATCH OIL SIDE LAMPS

Ever since the coming vogue of the square oil side lamp, our designers have been trying to produce a headlight that would match the business-like and artistic lines of the square line oil lamp.

A square headlight was out of the question. We have therefore designed a square line headlight (as looked at from the side, the point from which a car is generally seen.)

Particular attention is called to the square corners made up from straight lines, the ventilating holes in the hood are square also; socket of lamp is square, in fact everything is in harmony, and if you have square side oil lamps, you should have our 1908 headlight and then your lamp equipment will be in perfect harmony and up to date in every particular.

motor boats and gas engines in general. This type is made in 1 quart to 3 quart sizes, with 1 to 12 feeds, and ranges in price from $5.00 to $19.75.

The "Stapley" Compound Tire Pump

The Bridgeport Brass Co., Broadway and Murray streets, New York City, has recently placed on the market with a number of improvements the Stapley compound tire pump herewith illustrated.

The "Stapley" Compound Tire Pump

The pump cylinder is made of a seamless brass tube, and is fitted with a pressure gage. One of the features of the pump is an automatic valve-opener, which is a small plunger in the nipple which screws on to the valve in the tire, and automatically opens and closes the valve. A patented method of fastening the pump cylinder to the foot base is used, which makes an absolutely non-leakable joint, obliterating all threading, soldering and set screws.

TRUFFAULT HARTFORD SHOCK ABSORBER

Renders Real Rough Road Relief

The proper control of the springs secured only by the use of the Truffault-Hartford Shock Absorber, prevents excessive oscillation, insures less wear and tear, longer life of tires, greater speed and genuine comfort.

In the 1908 model we believe that we have practically obtained shock absorber perfection.

The friction discs are encased and telescope in cup-shaped brass discs, making practically a perfect bearing surface which gives the highest possible efficiency.

The end pieces have been simplified, making the application of the Shock Absorbers to the car a very easy matter.

A distinctly new feature has been added consisting of a regulating dial with indicator making it possible for even a novice to obtain a perfect and uniform adjustment to suit the exact requirements of the car as measured in terms of its gross weight and easily secure the maximum benefit.

The Truffault-Hartford is the only shock absorber manufactured with a regulating dial. It is automatically lubricated, absolutely dust and water proof, interchangeable, practically indestructible and fully guaranteed.

The superior and individual qualities of this pioneer of shock absorbers is best demonstrated by the fact that it is in use exclusively as part of the regular equipment of seventeen prominent automobile manufacturers.

The "Parker" Rim

The Parker rim is the invention of Mr. Orrel A. Parker, and is marketed by the Newmastic Tire Company, of Sixty-eighth street and Broadway, N. Y. City, makers of the well-known "Newmastic" Tire Filling.

The Parker rim consists of the regular standard one-piece clincher rim cut in two equal halves by the removal of about a quarter of an inch of the centre of the rim all the way round. The inside half of the rim is securely fastened to a plain band about the felloe of the wheel, and the other half may be taken off and on, and slides back and forth on the same band. This outer half is held in place by a stiff ring or flange, and is drawn towards the other half by bolts thru the felloe of the wheel. The chief difference between this rim and

Sectional View of the "Parker" Rim.

other rims is that it can be adjusted so that the edges of the clinch may be brought slightly together or left slightly wider than the standard clincher measurements. This change is so very slight that it has no effect on the wear of the tire, still it is sufficient to bring about the desired degree of inflation.

The inner tube used in connection with tire shoes on this rim is another recently introduced product of the Newmastic Co. The inner tube is made especially for use filled with "Newmastic," and is made so as to exactly fit inside the clincher casing, the variations in the size of the casings or any slight stretching is taken up by the adjustment in the rim. As the nuts are tightened the base of the tire is deprest, or in other words, the edges are drawn more closely together and the casing is drawn more tightly about the inner-tube. The tighter the casing is drawn the greater the degree of inflation and vice versa.

The new Parker rim will enable any user of tires to equip his machine with Newmastic without shipping his wheels to the factory, and he will also be able to inflate his tires to any desired degree, simply by using a wrench.

The Auto-Light manufactured by the Rolfe-Fox Co., of Rochester, N. Y., has recently been reduced in price from $20.00 to $12.50.

The "S. & W." Non-Skid

A new anti-skid has recently been brought out by the Story & Winkel Company, of Woodbury, N. J., known as the S. & W. Non-Skid.

Beside its non-skidding qualities it is claimed to be absolutely noiseless, easily attached, and to stay adjusted until taken off. The adjustment is novel, and is capable of wide range. The cross chains are attached to flexible steel cables which encircle the wheel, and are regulated by an adjusting strap which draws together the

The "S. & W." Non-Skid.

auxiliary cable running thru two small equalizing pulleys and secures an even adjustment all around the wheel. The device is strongly made of best materials, and the cross chains are interchangeable. The non-skids roll in a small package and are packed in a neat canvas bag when not in use.

The non-skids are made in all sizes for tires, from 28x3 to 36x5 inches. The 28x3 inch size lists at $10.00 per pair, and the 36x5 inch at $16.00 per pair.

New "Krome" Leather Fan Belt

The Chicago Rawhide Mfg. Co., 75-77 Ohio street. Chicago, Ill., is manufacturing a new V-shaped fan belt for use on grooved pulleys made of its Krome leather. This is a new mineral tanned leather which by many tests has proven to be extremely strong fibred and most durable. The belt is copper rivetted, and as it does not depend upon cement or glue, it is impossible for the belt to come apart, no matter how much oil or water may come in contact with it. The leather is also practically heat- and oil-proof, and it is claimed will not deteriorate and lose its strength.

The directors of the Peerless Motor Car Company, met on Monday, September 30, and declared its annual cash dividend of ten per cent.

PERFORMANCE OF

THE BOSCH MAGNETO

has well earned its reputation as the *Standard* Ignition System.

In the Morris Park Twenty-Four Hour Race with unerring reliability the Bosch ignition system, with which the THREE WINNING CARS (Fiat 1, Studebaker 2, Itala 3,) were equipped, again demonstrated beyond a doubt that the Bosch is the best ignition system in the World.

At the Brescia Races the Bosch Magneto was part equipment on twelve out of fourteen cars that finished the course under the rules of the German Emperor's Race, limiting cylinder area to eight litres,—won by Minovia on an Isotta Fraschini, averaging 64.7 miles per hour. Under the Grand Prix Rules Bosch Magnetos were part equipment on

ALL WINNING CARS

Race won by Cagno on an Itala, averaging 65.3 miles per hour. From Pekin to Paris; the first five cars in the Vanderbilt Cup Race; the Winners of the Emperor's Prize, Germany; the Grand Prix, France; Tourists' Trophy, England; Targa Florio, Italy; Ardennes (A. F. C.) Belgium; first Twenty-four hour Race at Morris Park won by Renault—were equipped with the Bosch Magneto.

These severe and extreme tests prove the reliability of the Bosch Magneto. On Touring Cars a perfect system of ignition is just as positively demanded. The Bosch Magneto is essential for use on motor vehicles of every class where gasolene engines are the method of propulsion.

Commercial Motor Car Department

Experience of Commercial Motor Car Users

More Speed and Costs Less to Maintain Than Horses

In giving their experience with the commercial motor car the Warfield-Pratt Howell Co., of Des Moines, Ia., state that they have run their truck for two years with complete success, and that it costs them 50 cents per day for charging the storage battery, for which amount it would be impossible to maintain a team.

The truck is a 5-ton Electric, built by the Vehicle Equipment Co., of Long Island, and is used to carry goods from their warehouse to the freight depots. They make about nine trips per day with a 5-ton load, which is about twice the number of trips that can be made with a team and wagon. They employ an operator at $48.00 per month. The car cost $4500. They claim it is the initial, not maintenance cost, which makes the motor car less used. No trouble was had in securing a driver, their plan being to take a raw man at the outset, who they state had stayed with it, and takes pride in handling the car in a practical and economical way.

They store their own car. Besides making more speed with the motor car they also have the advantage of securing an unloading door at freight houses. So far they have not had a great deal of expense, mainly tire expense, but not of very costly proportion.

Using Motor Car On Stage Line

Mr. J. F. Royer, of Greenwood Forks, B. C., has recently placed in service a 70 H. P. gasoline passenger 'bus, which he is using in connection with two 4-horse stages.

The motor car carries an average weight of one ton, and makes an average of 120 miles per day. One trip is made daily; 8 calls per trip. Gasoline costs $4.50 per day and lubricating oil $5.00 per month. The average monthly cost for repair work and repair parts is figured at $25.00. Mr. Royer considers it more advantageous to store his own car. He pays the operator $125.00 per month.

The average weight of load carried by the horse coach is 1 ton. One trip is made daily; 4 calls per trip; covering a radius of 60 to 85 miles. The horses cost $150.00 each; harness, $30.00 per set, and coaches $450.00 each. Twenty-four horses are constantly kept in service, costing $1.00 per day each for care and feed; $3.00 each per month for shoeing; while about $5.00 monthly is spent for repairs to vehicles. The driver is paid $100 per month, and $45.00 each for two helpers. Mr. Royer figures that the motor car depreciates $250.00; the horse $20.00, and each coach $50.00 per year, respectively.

Comparing the two summaries we find that the advantages of the motor car are not alone speed and mileage, but at the same time the daily up-keep of the car is less than half that of the horse equipment. Mr. Royer states that the horse-drawn vehicle possesses no advantages over the motor car. Lighter and less complicated chassis construction for the number of passengers carried is the most needed improvement in motor cars as suggested by his experience.

Can Make More Deliveries With Motor Car

John Simmons & Co., 110 Centre street, New York City, are using a 5-ton electric truck and two gasoline trucks of 3-ton and 1½-ton carrying capacity, respectively. The electric truck was built by the Vehicle Equipment Co., and the gasoline trucks are Knox Waterless cars built by the Knox Automobile Co.

An average of 25 miles daily is made by the 5- and 3-ton truck, and about 35 miles per day by the 1½-ton truck. They use these cars for hauling iron pipe, etc. Two trips are made daily, with from 15 to 20 calls per trip; covering New York City and outskirts. About 540 gallons of gasoline are used each month for the two Knox cars. They pay their drivers $16.00 per week.

One great advantage for this concern in the use of motor cars is the fact that big loads of heavy pipe can be transported to the points where the pipe is to be used, and only one loading and one unloading is necessary. Without the motor car it would be necessary to haul the pipes to a freight station, load it on cars, and then have it loaded, hauled by horses and unloaded again at the other end. The immense saving of time and labor is obvious.

Hosted by Google

One Motor Truck Replaces Two Four-Horse Teams

A 3-ton, 30 horse-power, Reliance gasoline truck is now being operated by Mr. W. L. Wheeler, proprietor of the Wheeler Transfer Line, of Menasha, Wis., for hauling groceries, baggage, papers, household goods, and nearly every class of merchandise. It takes the place of two four-horse teams previously employed.

With the truck Mr. Wheeler hauls an average load of about 3 tons, and makes an average of 50 miles daily, which includes two trips to Oshkosh, a distance of 16 miles—10 to 20 calls each trip. The car cost $2800. The average cost of gasoline and lubricating oil per day is $2.00. Repair work and repair parts cost him $10.00 per month. One operator is employed, who receives $50.00 per month. Mr. Wheeler stores his own car. He figures that his car depreciates 20 per cent. in value in a year.

With the two four-horse teams an average of 3 tons were carried, and a distance of about 25 miles covered per day. The wagons cost $400 each, horses $250 each, harness $60.00 per set. The average monthly cost of care and feed of each horse was $25.00; shoeing of each horse $1.50, and cost of repairs to each vehicle $5.00. The drivers were paid $40.00 per month. The depreciation in value in a year of a horse and truck was figured at 20 per cent. each.

Mr. Wheeler suggests that tires should be improved in order to make the motor car more successful, and states that the greatest advantage of the motor car over the horse-drawn vehicle is in making long hauls, but says that the horse is best on muddy roads.

New York's Fifth Avenue Gasoline Motor 'Bus Line

New York's old horse omnibus service on Fifth avenue has been succeeded by a line of new gasoline motor omnibuses. The New York Transportation Company has placed in service fifteen machines, the first being put in operation about the middle of July, and the others as soon as they were assembled. The machines are of the double-deck type. The chasses were received from the London agents of the De Dion factory in France, in a "knocked down" condition, and reassembled in New York. The bodies were built by Fulton & Walker Company, Philadelphia. The seating capacity is thirty-four, sixteen inside and eighteen on the upper deck. The 'buses at present are being operated from Washington Square to Fifteenth street only, a distance of a little over four miles. The regular schedule allows one hour for the round trip, including a stop of five minutes at each end. The average running speed is ten miles per hour. The fare charged is 10 cents.

More Speed, Heavier Loads and Less Expense with Motor Car

The Findlay Auto Transit Company, 1321-2 North Main street, Findlay, O., recently purchased a Reliance Model I, 28-30 horse-power gasoline truck, and has been running the same principally to and from Riverside Park in that city, carrying passengers. The car carries a load of about 3000 pounds each trip, and has proved entirely satisfactory. The distance to and from the Park is about 1½ miles each way. The car is run from 12 to 18 hours per day, a round trip being made about every 30 minutes. The car cost $3110. and is figured to depreciate from $300 to $500 in value in a year. The maintenance expenses are as follows: Gasoline, $77.00 per month; lubricating oil, $5.00; repair work and repair parts, $8.00; storage, $3.00; operator's wages, $80.00, and helper's wages, $60 per month.

The most needed improvement in motor cars suggested by their experience is to produce solid tires that will stay on the wheel. They claim that their tires give out. No trouble has been experienced in securing a suitable driver.

Mining Companies Use Automobiles For Inspection Work

The Coal & Iron Company, of Pottsville, Pa., is furnishing its mine bosses with automobiles for use on their tours of inspection, to take the place of mule power.

The Reading officials have already placed an order with the Maxwell-Briscoe Motor Company for two of their 16 H. P. cars converted into runabouts, and will very likely order 16 more if these prove satisfactory.

At the present time some of the subordinate officials travel from colliery to colliery by mule power, and the time wasted in traveling is so considerable that they have come to regard the automobile as a necessary adjunct to their business.

Ropkins & Co., of Hartford, Conn., have used a Knox truck for the past three years, and report that the same has given good satisfaction. They say it is not cheaper than horses, altho it has the advantage of covering more mileage, quicker delivery, and is a great advertiser.

Biglow-Kennard Co., Boston, Mass., use one of the General Vehicle Co.'s 10 H. P. electric trucks for handling clocks, bronzes, silverware, etc., work previously done by a 2-horse team and a light, covered wagon. The truck covers a mileage of 25 daily in a radius of 15 miles. The average load is 500 pounds. The cost for battery charging is $30 per month, for storage $20, and for operator $60.

Hosted by Google

ffers for 1908 a three ton spiral gear rive truck, the peculiar feature being the hange from bevel gears to the spiral gear rive. This is the Hindley drive manu-

Fig. 1. Mitchell 1908, 3000 pounds, paying load truck. Wheel base, 110 inches; gage, inches; solid tires, 32x3½ inches in rear, and 32x3 inches front; motor, 4, 4x4-inch cylinders, same as runabout motors, 20 B. H. P. at 950 R. P. M. Sliding gear, three forward speeds an reverse, with spiral gear, hardened steel, for both the worm and the worm-gear, to divided r axles. Weight of truck, standard platform, 2300 pounds, as shown in illustration. Price, $2 including three oil lamps, top and tools.

actured by Morse, Williams and Co., of Philadelphia, and was described in the January, 1907 Journal, page 232. This gear is rather more costly than the bevel gear, but, it is claimed, has very marked advantages in the way of silence, smoothness of action and impossibility of breakage, which are expected to bring the spiral gear into very large use. The Mitchell company has been pushed to fill its orders for passenger cars, and has therefore made no effort to extend the sale of its tr up to the present time. It is believed the large increase of 1908 factory capa will permit the company to exploit spiral gear drive, in which their engin have unbounded confidence.

The same four-cylinder motor is as on the 1908 runabout, described in other part of this issue. This moto shown in the accompanying illustra A magneto is used and located at the of the engine. A stiff frame work

New Lindsay Commercial Car Axle

. J. Lindsay, of Indianapolis, Ind., has ly brought out a new spur or herring-e Gear Direct Drive Axle for light de-ry wagons and trucks.

ll the gears in this construction can adjusted. The shaft sections carry the l and receive the end thrust of the eels, and are provided with end thrust rings. Wear of these bearings is en up by the spindle nut at the end of hub. All the gearing runs in oil. The el pinion on the drive shaft is made a sleeve that is feathered on to the e shaft and can be adjusted forward back on the shaft. It engages with a el gear that is carried by the square rmediate shaft, and can be adjusted mesh with the bevel pinion. The in-hediate shaft carries a spur or herring-

disturbing the shaft-sections.

This construction enables the manufa turer to reduce the diameters of the gear thereby gaining a greater amount of roa clearance, power, and long life, ratio gears being the same.

It eliminates the use of big end thru bearings, and large costly bevel gear This axle is furnished with a first-clas planetary transmission attached or wit out a transmission, as desired.

The standard axle has 37 inch sprin centers. The shaft-sections are 1½ inc diameter. The drive shaft is 1¼ inc diameter and is flanged at the front en The ratio of gear is six to one.

All the gears have 1⅝ inch face, ar are 5 D. P. The tooth of the master ge is spur type.

The New Lindsay Spur Gear Drive Axle.

1908 DELIVERY CAR

MODEL D. C., 4 H. P., $550; 8 H. P. $650

Fitchburg, Mass., Sept. 25, 1907.

WALTHAM MANUFACTURING CO.,
Waltham, Mass.

Gentlemen:

Perhaps you may care to hear of a trip that I made July 4th to demonstrate the good qualities of my Delivery Car—Model DC 4-HP.

There is a young man here who has been talking of buying one to use on a poultry farm. He had called upon me twice and I had called on him some six or eight times, and I felt very sure that if I could make a good demonstration, I could make a sale, so I agreed to meet him at ten o'clock, July 4th, and we would go up to his farm which is about eight miles out from the city. I met him as agreed, and as he had a friend with him I had nearly 200 pounds extra load. The combined weight of us three was 545 pounds. For the first five miles I was well acquainted with the road; then we turned on to a road that I had never been over and for three miles I drove my car over the roughest and worst road that I ever want to see. There were places where grass had covered the entire width of the road and other places where one side was washed out; there were deep gullies across the road; there were places where the brush was so close that the fenders on each side of car would hit. It was a steady ascent with no very steep grades but one that called for very careful driving.

At last I caught a glimpse of a house through the trees and began to feel better, but just before we reached the house there was a sharp turn in the road and all that we had passed was but play to what was before us.

We were at the foot of a hill some five rods long, covered with small pebbles and it was the steepest grade that I ever remember riding over, either with team or auto. But my faith in the little motor was strong and I started; about one-third of the way up I thought what if something should break—I would be in a fix—so I stopped and asked one man to get off and walk behind with a big rail to block the wheels in case of an accident to brake or power. But nothing happened and we reached the top in safety, and I want to say right here that I made a standing start on the steep hill and reached the top as quick—if not a good deal quicker—than a horse could, and the friction transmission did not slip.

That was the worst hill on the trip for the rest was easy. I stopped and waited for the man to come up, looked the machine all over; oiled up; and soon reached our destination.

When we were ready to return I asked if there was another road home. He said "Oh, yes," go about half a mile and we would have State Road all the way home.

I have run my car over 3000 miles and the friction is in fine condition yet. All the trouble I have had has been in the tires. Nails and glass bottles are bad for rubber.

Yours very truly,
W. A. YALE.

Motor Cycle Department

Valuable Suggestions to Motor-Cycle Dealers

As has been the practice in other lines of business, and wisely so, L. E. French, now connected with the American Motor Co., of Brockton, Mass., maker of the M. M. motorcycle, has prepared a series of instructions for motorcycle dealers comprising a great many valuable suggestions. After setting forth the wisdom of selecting a machine entirely on its merits, and not because of the size of the trade discount allowed Mr. French, who is a graduate of the Engineering Department of Harvard University, goes on to enumerate and explain five characteristics of a successful motorcycle dealer, and below we quote numerous extracts from his suggestions and remarks:

"1—It will pay you in every way to understand your machine. You will save expense because you can make necessary adjustments yourself quickly and without delay. The man who understands his machine is rarely troubled by having it stop on the road and he can locate, quickly and accurately, any trouble that does occur. There is nothing that queers a new machine so quickly as having it stop or give trouble in a public place.

"2—It pays the agent to keep his machine well cleaned and the nickel parts polished. The ordinary motorcycle outfit is repulsive. The oil is allowed to collect on the engine and this catches the dirt. The nickel parts become dull, and the whole machine is coated with dust. With the motorcycle in this condition the rider naturally wears his oldest clothes and the outfit is certainly not attractive. This accounts in some measure for the aversion of a certain class of people to motorcycles.

"Cleaning the machine each time you return from a ride is largely a matter of habit, and takes only a little time, since the dirt does not accumulate. It also enables you to locate loose nuts.

"To clean the engine spray around the recesses with gasoline from an oil can. Place under the engine a flat pie pan to catch the drippings and apply gasoline from this, with a small paint brush. When clean finish with a dry rag or piece of waste. The nickel parts should be cleaned once a week with brass polish.

"3—Everyone before buying a machine takes the precaution of looking up the good points of several different makes. The buyer comes to you to hear what you have to say about your machine. He expects you to exaggerate its merits, and is waiting to disbelieve anything that sounds in the least unreasonable. Later he will question others about the same things and draw his own conclusions. Tell him in the fewest number of words why you selected the particular machine you handle, in preference to other makes.

"The buyer then asks you what you think of the — machine. If you know nothing of this machine, and tell him it is "Perfectly Rotten," and "You wouldn't have it for a Christmas gift, etc., he wisely concludes that you are prejudiced and that you only want his cash after all, so he goes away disgusted, and later buys the — machine. Now if you have previously looked up the machine you are all ready for him. When he asks the above question you can tell him candidly what your own investigations have taught you, and he will conclude that you are fair-minded.

"4—In many cases the agent has the idea at first, that all he has to do is to wait for the people to come to him and place orders. If such an agent is lucky, he may be run into by some one who is just about to order a machine, but the chances are that in a short while he will be replaced by someone who wants to make a little money.

"There are thousands of people in this country who want automobiles, but who cannot afford them. Anyone can afford a motorcycle, if he is thoroughly convinced that he needs it, and there are thousands who need it but haven't realized the possibilities or advantages of the machine. Such people need personal contact; they must see for themselves to be convinced. This work has to be done by the agent. The commission paid is very large, and if the manufacturer could sell direct to the public, he would double his profit. He does not pay the agent this price for doing what he could do as well himself. To do business then, the agent must go out after the orders, not wait for them to come to him.

"The first thing to do is to make a list of the people in your territory who could use motorcycles to advantage: doctors, drummers, and anyone who has to travel for business on frequent short trips of twenty miles or more. Visit these people and explain to them the advantages of the motorcycle over the horse, electric car, train, etc., and its cheapness of cost and maintenance.

"When a man is interested, give him a short ride on a good piece of straight road, but do not lend the machine promiscuously to your friends, for, not understanding it,

Let people see you using the machine stantly for every day purposes. After eral weeks use, people notice that your chine is always in order and is clean attractive, and that you do not have wear old clothes.

5—Organize a motorcycle club in your n, or join it, if they have one, and win ew contests. There is nothing like ting a man to make him want a better chine. Notices of motorcycle club s may be put in the local paper free harge, and will arouse general interest.

In the rear wheel forty spokes are d, and in the front wheel thirty-six. tires are G & J 2½-inch double her type.

finger Motor used on the Royal Motor Cycle.

e Royal grip control is made entire- om steel parts, milled and machined solid stock, and is designed to te properly at any angle at which handle bar may turn. The right when turned to the left, closes the ust valve and advances the spark. left grip, when turned to the left, s the throttle, giving more gas to the e. The grips are of good proportion, of soft rubber and covered with calf cemented on and hand-stitched. The are 14-gage seamless steel tubing with separate bolts for operating the nder and holding the bar.

e wheel base is 52 inches, which

a single cylinder, 2¼ H. P., chain drive machine; model "B," a 3 H. P., singl cylinder gear driven machine, and mode "C," a 5 H. P., double cylinder, gear drive machine. The three motors are all "Thor products, made especially for the Ligh Company.

The newest feature on models "B" an "C," is the gear drive which is a part o the motor and contained in the moto base, comprising a spur gear which is at tached to the main shaft of the motor The motor shaft runs on roller bearings The pinion engages with an internal gea of large diameter. This internal gear i cut on the inner surface of a large disk which has a center to which the drive sprocket it attached. The center of th side to which the gear is cut forms a shaf which sets in ball bearings. The outsid diameter of this internal gear also run in ball bearings, thus the friction of thi drive is reduced to the smallest fraction and as it is contained in any a part o the motor it is impossible for it to get ou of alignment or adjustment. It is constant ly running in oil which is supplied fron the motor base, thus making it absolutel silent. The device is not an experiment but has been tested out in a motorcycl for the past eight months over rough road and has been adopted and used in com prest air motors where pneumatic tool are used and subjected to greater abuse

In connection with this motor is use a new design of muffler called "Radio," manufactured by the Light Company. Th discharged gases are past into a tub or chamber, where it is divided among a number of ⅞-inch tubes which are expose to the air. These carry the gases into a smaller chamber and then out into th open.

All three models will be equipt wit up-to-date grip controls. All the model have new design drop truss frames an a new type of tank designed to hold gaso line, oil and three standard dry cells.

The arrangement of the coil on these models is such that the wires are ver short, and placed in close communicatio with the motor and batteries, for the pur pose of obtaining longer battery service

All chains used are of ⅝ pitch. Th regular equipment includes G and J 2¼ inch tires; 2½-inch tires being extra Sager spring forks are used on all of these models.

The Light Co. is in position to mak immediate delivery of the 2¼ and 3 H. P models and April 1st delivery on the

side bolt on the clamp and a set scre
locks the saddle to the seat post and pe
mits tilting of the saddle to any desire
position.

The "Pfanstiehl" Motor Cycle Coil

In addition to the Pfanstiehl autom
bile coils described in our August, 1907, i
sue, page 148, the Pfanstiehl Electric
Laboratory of North Chicago, Ill., is als
manufacturing a motor cycle coil, whic
is constructed along the same lines a
its automobile units, having the sam
remarkable efficiency and producing th
"Caterpillar Flame."

The coil is compact and neat in appea
ance and its windings are so arranged an
balanced that the coil responds very quic
ly, allowing for a short length of conta
at the timer, thus insuring low curren
consumption and giving very accurat
timing of the motor. The coil is put u
in a polished hard fibre water-proof an
non-breakable case. It is fitted with thre
or four terminals or flexible wire leads, o
binding posts as desired. The size of th
coil is 2¾ by 5½ inches, and the weigh
2½ pounds.

B. & S. General Service Wrenches

he Hudson River Motor Boat Carnival

Altho bad weather prevailed nearly all eek, the third annual motorboat carnival the Motor Boat Club of America, on e Hudson, proved very successful. rene," a beamy, comfortable 40 footer, ilt by John S. Sheppard, of Essington, ., from his own designs, and equipt th two four-cylinder Chadwick motors 8-inch bore and 7-inch stroke, made an ceptional record, by carrying everything over the river eight boats started for reliability trials. Owing to the threat ing conditions of the weather the comm tee experienced some trouble in secur observers, yet at the appointed time eve thing was in readiness and the ev started with the following boats: Du II, Sparrow, Speedway, Speedway, Jr., open boats, and Mao II, Myosotis, Ral and Idler cruisers. The course was l off from the club-house at the foot of C Hundred and Eighth street, N. Y. City, t buoy up the river off Fort Washing Point, and thence to another buoy loca close to the Jersey shore about oppos Sixty-ninth street, and from this back the start at the club-house, the course be ten nautical miles in length. This sa course was used thruout the week for events except the mile trials and the lo dictance race. Sparrow and Speedw came around first close together, and fact, made a pretty race thruout the wh run until Sparrow ran out of fuel on ninth lap and was compelled to give

Irene, winner of the International Cup Championship on the Hudson River.

fore her in the speed-boat class. The ene besides winning the International p championship broke the one-mile cord. Time 2.17, or at the rate of 30¼ atute miles per hour. One of the features this year's meet was the large number cruising boats which competed, and furshed many close finishes.

sible to state the winner of this event, the measurements of the two latter bo are not known.

TUESDAY'S EVENTS.

On Tuesday, the second day, the n trials were run, but owing to some c fusion in the timing the trials were run Friday.

Digitized by Google

tiest ever seen on the river, with the Dixie leading. When the boats returned the Irene was leading by 200 yards, and as the Dixie came up opposite the club-house, she slowed down and stopt, her propeller being put out of commission by coming into contact with a log. The Irene continued her first round in 25 m., 38 s., actual time. Three minutes later Den finished the circuit in one second less than Irene. Skedaddle followed in 26 m., 18 sec. Shortly after the boats past the home mark a heavy rain squall set in, during which time Irene's ignition mechanism was soaked, compelling her to quit, and the Den had struck a log causing her to return to anchor. This left Skedaddle the only survivor who finished at 6:08:46, making the best round of the course thruout the carnival, 24 m., 40 sec.

WEDNESDAY.

Wednesday, the third day, was the start of the series races for the Manufacturers' Association cups, and the cruiser classes in which there were 26 contestants. The start was made at 2 p. m. The cruisers were to make two rounds, while the racers which followed covered a distance of thirty miles.

Sparrow finished first in her class, the Idler made the best time in hers, and Ailsa Craig finished ahead of her only competitor.

In the National trophy class X. P. D. N. C. gained three points, Skedaddle two and Speedway one. In the International cup race Den won two points.

THURSDAY.

Thursday the series races were continued. In the cruiser class, practically the same boats started. Dixie and Irene fought it out for the International trophy, with Irene leading at the finish of the first round, by 1 m. 10 s. At the start of the second round the Dixie dropt out, leaving the Irene to finish, which she did in 1:15:07, the fastest time so far made for 30 miles.

FRIDAY.

On Friday the series races were completed. The mile trials were also run off in the morning. Den and Skedaddle were the only boats to run. Each of the boats made three runs with the tide once against it, going over the line in either direction. The results given show that Den made 28.71 statute miles per hour, and Skedaddle 26.909. In the series races on the following day, the Irene and Den determined to fight to the finish, and the race between the two was the prettiest of the carnival. Irene took the lead but lost on the turn, only to take it again on the stretch. She covered the first round 1 m., 1 s., ahead; the second a little less than 2 m., and won finally by not quite 4 m. In the National cup race Skedaddle beat X. P. D. N. C. by 4 sec. Only two boats finished in the Interstate trophy, Sparrow and Artful, with Sparrow making the best time each day.

THE LAST DAY.

Saturday the last day was set for long distance races. The racers were run to Poughkeepsie 116.3 nautical miles with 6 starters, and the cruisers to Peekskill 75 nautical miles, with 14 starters. After the long distance contestants had been started the Irene was allowed to make six runs of the mile for a record, but not as a competitor for the mile trials cup.

In the long distance race for cruisers, Grayling covered the course in 4 h., 22 m. In the racer class, Den and Skedaddle finished within one minute of each other, with Den in the lead. The winners of these classes are not yet determined, as a number of the boats had not been measured.

The following table gives an idea of the time made by the Irene in its speed trials:

Down . . .	2.17—26.277	25.904	25.815	25.770	25.694	
Up	2.21—25.532	25.726				
Down . . .	2 17—26 277	25.726	25 726	25.619	25.500	25 597
Up	2.23—25.175	25.300	25.513	25.382		
Down . . .	2.18—26.087	25.205	25.252			
Up	2.28—24.324					

Pittsburg Regatta

The final regatta of the Pittsburg Launch Club, was held on September 28, over a three mile course on the Allegheny river; all races not otherwise designated being for that distance. The races proved very successful. Following is a summary:

Race for 3 to 6 H. P. launches—1, Ku Chu (H. L. Sipe and L. McMasters), time 21m. 30s.; 2, Silbon, (Gus Probst and D. McCready); 3, Rainmaker (W. J. and H. McGivern); 4, Paul (Chas. H. Burke and Chas. Clintner). Race for boats up to 11 H. P.—1, Helen (W. A. Tomlinson), time 15m. 45s.; 2, Skipper (Jos. and Wm. Curry). Six-mile race for launches with not more than 17 H. P.—1, Hornet (M. P. Sauers and F. Smith), time 26m. 30s.; 2, Tranter (J. F. Robertson and P. H. Magnus). Nine-mile race for launches with not more than 25 H. P.—1, Water Witch (J. Kowalsky and M. T. Epling), time 35m.; 2, El Rayo (G. E. Kallock). Race against time—Sprinter (H. C. Price), no other competitors, time 8m. 35s.

The "Bath" 26 Foot Runabout

The Bath Marine Construction Company, Bath, Maine, is offering for 1908 a new 26 foot 6 inches by 5 foot runabout herewith shown.

The frames, floors, keel, deadwood, stem, stern board, sheer strake, covering board, clamps, stringers and all parts requiring special strength are of clear straight grained white oak. The planking is of clear white pine with only one butt in each strake, the butts being reinforced with white oak butt blocks.

The interior finish can be had in oak or cypress. The deck is of clear white pine, and all deck fittings, such as bitts, chocks, flag pole sockets, and steering wheel cleats, are of brass.

The "Bath" 26 feet 6 inches by 5 feet Runabout.

The motor can be started, steered and controlled from the bulkhead. The price of the runabout, hull only, with coaming run around in the usual manner, is $350; hull only, with turtle back over engine, $400. The hulls are fitted with 7½, 11, 15 or 25 H. P. motors, listing at $196; $277, $345 and $517, respectively. If the engine is to be controlled from the bulkhead $20 should be added to the above prices, and $30 if the engine is to be started from the bulkhead. If boat is to be finished in mahagony $100 extra is charged. An auto cover and side curtains with celluloid windows is fitted for $100 extra, and $25 extra is charged for a canvas cover over the engine.

"Casey" Spark Plug Protector

One of the latest spark plug protectors placed on the market is the Casey protector, manufactured by Casey Spark Plug protector Company, Cocoa, Fla.

The protector consists of a metal plate 2½ inches in diameter by ⅛ inch thick, having a hole in the center into which the spark plug is screwed. Over this

The "Casey" Spark Plug Protector.

plate a hood of polished brass, 3½ inches high by 2½ inches diameter, is set. This hood has a hole or opening in its side in which is placed a flexible rubber bushing. This bushing will accommodate any size wire to be used for connections with spark plug and battery.

The spark plug is first screwed into the metal plate, and then into the engine, the end of wire from the battery is past thru the rubber bushing, and then thru the hole in the side of the hood, making it fast to the spark plug, care being taken to have the insulation of the wire come up close to the plug, in order to prevent long insulated ends of wire extending from the plug. After these connections have been made the hood is slipt down over the spark plug and plate, thereby completely housing in the plug so that no amount of rain or spray can short-circuit it.

It is claimed that this protector also prevents getting a shock from the spark plug, and that should it be accidentally damaged it can easily be put into shape with a wrench or hammer. The hood is made to fit any spark plug of standard size, and lists at $1.00.

For Cleaning Auto Bodies

It's good to see how quickly Mobo removes mud, grease and dirt from an automobile body. It doesn't matter how long the car has gone without cleaning, or how thick the dirt may be—off it comes, easily and quickly if you use

MOBO
Automobile Cleanser

Not only does it remove all the dirt, but does it without marring or scratching the varnished surface, and without dimming the lustre in any way. That's Mobo style.

Mobo is composed of pure vegetable oils, and contains nothing rough to mark the smoothest surface. It is the ideal automobile cleanser.

Prevents the varnish and paint from cracking and blistering. Keeps the car looking new. It's the best sold to-day. Try it once and you'll understand why.

Put up in 3 lb. and 6 lb. cans; also in tubs, half-barrels and barrels. Can be had at the following supply house:

Adolph Krouse
832 Arch Street
Philadelphia, Pa.

and at all good automobile supply stores in all leading cities.

stituted; the empty cartridge to be
ed for future use. A number of
h cartridges can be filled and
t on hand. By this means it is not
essary to pour the gasoline or other
uid into the receiving vessel for the
t or car, but the cartridge is quickly
ached, and then a suitable valve is
ned, permitting its contents to be used
needed.

'Jencick" Auto and Marine Motors

The Jencick Gasoline Motor Manufac-
ing Company, Port Chester, N. Y., are
ering a complete line of automobile
l marine motors in eight sizes from 15
210 horse-power, listing from $550 to
00.

The Jencick motor has vertical water-
led cylinders cast in units of close
ined gray iron, the water jackets be-
cast integral with the cylinders. The
et and exhaust valves are on opposite
es of the cylinders, and are machined
a single forging of a special alloy con-
ning a high percentage of nickel. The
ton is of the trunk pattern with domed
d and made extra long to give great
aring surface and positive guidance to
rings. Each piston is fitted with four
gs, three at the head and one about

means of chrome nickel steel studs a
nuts, all cotter pinned.

The carburetor is of the float feed typ
The manufacturers allow a choice of a
of three systems of ignition for moto
made under eighty horse-power, and t
systems for the larger ones. Their mak
and-break system is actuated by a sing
cam, and is easily accessible on the t
of the motor. It is fitted with a device
prevent reversal of the motor, and ru
on Hess-Bright ball bearings. The Bos
low tension magneto is used for the
make-and-break system, and the Bos
high tension, with a choice of plugs a
coil for jump spark.

A "Jencick" 4-Cylinder Motor, Inlet Side.

Lubrication is by a Pedersen mecha
cal sight feed oiler, located on the re
part of the motor, and driven by a b
from the magneto shaft. In addition
this they use a plunger pump on the n
rine motors which forces the oil to t
crank and wrist pin bearings under
pressure of 125 pounds.

The standard equipment furnished wi
every motor consists of a float feed c
buretor, magneto or battery and coil, jum
spark plugs or make-and-break plugs,
nition cable, oil pump, water pump. I
dersen mechanical oiler, starting devi
and controls.

Here you are at last,

5,054 Delivered to News Company.

17,226
1,102 Returned by News Company, to November 16, 1907.

16,124 Net total paid.

We print on this page each month an exact statement of the number of copies printed and distributed of the preceding issue of "The Cycle and Automobile Trade Journal."

The bindery count of actual complete copies produced of the November issue was 20,119.

Of these, 25,594 pounds were mailed at pound rates, as shown by post office receipts. Each copy weighs 29 ounces, representing 14,121 copies, and 2,069 copies of back numbers and copies returned by news companies are accounted for, in addition to the total for the month.

We will be pleased to verify the above figures at any time to any one interested.

The Cycle & Automobile Trade Journal will be represented hereafter in England by T. A. Robinson, 148 Old street, London, E. C., to whom we refer all inquiries in the United Kingdom on subscription and advertisements.

Mr. G. H. Smith, of the United Motor Industries, Ltd., of London, England, the oldest established motor and accessory fitting firm outside of France, will on December 26, visit America for the purpose of arranging agencies for any American novelties in the way of motor accessories that manufacturers may be prepared to place. Mr. Smith, while in America, will stay at Hotel Astor, New York City.

Automobile Coming Events

November 22-30—Annual Stanley Show, London, England.

November 29-December 6—Chicago Automobile Parts Show, Casino Garden.

November 30-December 7—Chicago National Automobile Show, S. A. Miles, Mgr., 7 E. Forty-second street, New York City.

December 5-22—Touring Car Exhibition at Berlin, Germany, under direction of Kaiserlicher Automobile Club.

December 8—Paris, Straightaway Aeroplane Speed Test, auspices of "L'Auto."

December 9-14—San Francisco, Coliseum, First Annual Automobile Show, Automobile Dealers of California. N. R. Cooper, Mgr.

December 13—Paris, Competition for Agricultural Automobiles, auspices of "L'Auto."

December 14-21—Local Show, St. Louis, Mo., Auto Manufacturers' and Dealers' Association.

December 19-22—Commercial Vehicle Exhibition at Berlin, Germany, under direction of Kaiserlicher Automobile Club.

December 21-January 2—Automobile Show, Brussels, Belgium.

December 26-28—Reliability Trials of the South Indian Motor Union.

December 28-January 4—Importers Salon, Madison Square Garden, New York City, C. R. Mabley, Sec. and Mgr.

1908.

January 18-February 2—Fifth International Auto Exposition, Palace of Fine Arts, Valentino Park, Auto Club of Turin, Italy.

January 4-11—Dublin Show, Ireland.

January 14-18—Automobile Show, Foot Guard Armory, Hartford, Conn.

February 10-15—Detroit, Mich., Tri-State Automobile and Sportsmen's Association's Show in Light Guard Armory.

March 7-14—Sixth Annual Auto Show at Mechanics Building, Boston, Mass., Boston Automobile Dealers' Association, Chester E. Campbell, Mgr., 5 Park Square, Boston.

March 9-14—Buffalo, N. Y., Automobile Show, Buffalo Automobile Club, 760 Main street, Buffalo, David H. Lewis, Secretary.

March 20-28—Automobile Show, Liverpool, England.

March 21-28—Cordingly Show, London, England.

March 21-28—Auto Show, St. Lawrence Rink, Toronto, Canada, M. Jaffry, Mgr.

March 26-April 24—Second Annual International Commercial Vehicle and Motor Boat Show Olympia, London. Society Motor Manufacturers and Traders.

April 5-12—Third Annual Automobile and Sportsmen's Show, Montreal, Canada, Arena, M. Jaffry, Mgr.

April 16-21—Second Annual Show of the Pittsburg, Pa., Automobile Club.

May 12—Sicily, Targa Florio, Automobile Club of Italy.

June 20-July 5—Grand Prix, Dieppe Circuit, Automobile Club of France. (Exact date to be announced.)

Hosted by Google

Budlong Now Heads A. L. A. M.

At the annual meeting of the Association of Licensed Automobile Manufacturers in New York City, November 6, thirty of the thirty-one members were present, and officers were elected for the ensuing year.

Mr. M. J. Budlong was elected general manager, to fill the vacancy caused by the retirement of E. H. Cutler.

The officers chosen are: Charles Clifton, of the Pierce Company, president; Thomas Henderson, of the Winton Company, vice-president; H. H. Franklin, of the Franklin Company, treasurer, and L. H. Kittridge, of the Peerless Company, secretary.

The Executive Committee will be composed of Charles Clifton, W. E. Metzger, S. T. Davis, George H. Day and Thomas Henderson.

Immediately preceding this action, and following the provisions of the new constitution and by-laws adopted at the Atlantic City meeting, the following directors were elected:

For a three-year term—W. S. Gorton, Standard Welding Co.; H. S. White, Shelby Steel Tube Co.; P. S. Steenstrup, Hyatt Roller Bearing Co.; H. E. Raymond, The B. F. Goodrich Co.; for two years—C. E. Whitney, The Whitney Manufacturing Co.; D. J. Post, Veeder Manufacturing Co.; C. T. Byrne, Byrne, Kingston & Co.; W. H. Chapin, Brown-Lipe Co.; for one year—E. S. Fretz, Light Manufacturing and Foundry Co.; H. T. Dunn, Fisk Rubber Co.; F. E. Castle, Gray & Davis; L. M. Wainwright, Diamond Chain & Manufacturing Co.

Engineers Meet

A well-attended meeting of the Mechanical Branch of the Association of Licensed Automobile Manufacturers was held November 7, at their offices, 7 East Forty-second street, New York City. Owing to the presence in the city of so many engineers from the leading factories, the discussions on the various subjects were of more than usual interest.

The topics considered were safety starting handles, models of some new inventions being exhibited; the problem of eliminating noise in valve timing gears, the shape of cams, the properties of valve springs and engine torque at various speeds. After the meeting the members visited a laboratory and witnessed tests of a new type of two-cycle engine.

Henderson Chosen to Head N. A. A. M.

Thomas Henderson, of the Winton Motor Carriage Company, of Cleveland, O., was elected president of the National Association of Automobile Manufacturers at its recent annual meeting in New York City. The by-laws were amended, so that the initiation fee will be $500, instead of $25. In accordance with a request of the A. A. A., the president was instructed to make such appointments for a reference committee. The suggestions relative to racing on circular tracks, recently adopted by a conference under the auspices of the A. A. A., were referred to the contest committee for action. Messrs. S. T. Davis, Jr., L. H. Kittridge, William E. Metzger, Charles Clifton and S. D. Waldon were reelected as members of the executive committee, and the following officers were reelected:

Vice-president, S. D. Waldon, Packard Company; second vice-president, William E. Metzger, Cadillac Company; third vice-president, L. H. Kittridge, Peerless Company; secretary, C. C. Hildebrand, Stevens-Duryea Company; treasurer, William R. Innis, Studebaker Company.

Annual Meeting of M. & M. A.

About sixty members attended the annual meeting of the Motor & Accessory Manufacturers' Association, held in Hotel Astor, New York City, on November 6. The president's report covered a brief outline of the growth of the association since its organiatizon in February 11, 1904, at Cleveland. The treasurer's report showed an ample balance in the treasury, and it was definitely decided to establish permanent headquarters for the association. The following officers were elected: H. S. White, president; H. E. Raymond, first vice-president; H. T. Dunn, second vice-president; F. E. Castle, third vice-president; W. S. Gorton, treasurer; P. S. Steenstrup, secretary.

Philadelphia's Most Successful Show

Considering the limited amount of space afforded by the First Regiment Armory the seventh annual automobile exhibition of the Philadelphia Automobile Trades' Association, held November 9-16, proved to be the most successful show ever held in that city.

The setting was that of an out-of-doors effect secured by decorating the booths with an abundance of autumn foliage, while the floors of the booths were carpeted with a grass green burlap, with a similar material of a gravel color representing paths. The sidewalks and ceilings were covered with blue and yellow bunting, while each exhibit was designated by a golden banner with the names of the cars in crimson lettering.

The attendance was remarkably large, the armory being crowded to such an extent that it interfered with business. Altho the committee followed out the scheme of the New York shows and charged double admission on Tuesday and Thursday evenings, the attendance was large.

Meeting of the A. A. A. Legislative Board

On October 31st, at Grand Central Palace, President Hotchkiss of the American Automobile Association called to order the convention of the members of the Association interested in legislation. Mr. Charles Thaddeus Terry, chairman of the Legislative Board, in his address stated that the Legislative Board has kept in touch with the legislative situation in the various States, in the legislatures of which at the last session statues relating to automobiles had been presented. Altho the general trend of the legislation as gathered from the data collected points to a larger degree of fairness than heretofore, it is to be regreted that automobile legislation is even yet of so divergent a nature thruout the States as to indicate an imperative demand for one of two things—either the speedy enactment of a federal law or the enactment thruout the States of a uniform State law framed upon the best of the present state laws as a model with improvements thereon if possible.

Three A's Re-Elect Old Officers

On November 8 the Board of Directors of the American Automobile Association held its annual meeting in New York City, and unanimously re-elected the officers as follows: President, William H. Hotchkiss, of Buffalo; first vice-president, Lewis R. Speare, of Boston; second vice-president, Asa Paine, of Minneapolis; treasurer, George E. Farrington, and secretary, F. H. Elliott.

Besides the election of officers and a vote to increase the Board from 11 to 17 members, the meeting was taken up by reading the annual reports of the officers.

The report of the secretary showed the membership of the association at this time to be as follows: Sixteen affiliated State associations, comprising 120 clubs, with a membership of 17,550; 15 unfederated clubs, with a membership of 1035; three life members and 621 individual members; in all, a membership at this date of 19,-209.

The treasurer's report, November 1, showed a balance on hand of $4,851.03. The total receipts from February 1 to November 1 were $20,862.85, including the balance carried over.

Action was taken vesting the Racing Board with control over all speed contests, including races between stock touring cars.

A. M. C. M. A. Plans to Invade Foreign Market on Wholesale Scale

Following its convictions that the time is ripe for an invasion of the foreign automobile markets on a wholesale scale, the Committee of Management of the American motor Car Manufacturers' Association, at a recent meeting, delegated its general manager, Alfred Reeves, to visit the London and Paris automobile shows to study foreign conditions, with the view of paving the way for the 51 makers in the organization to reach the foreign markets.

The best methods for selling cars, whether thru agents or branch houses, the plan of advertising campaign that should be followed, and other details are to be carefully investigated.

It was also decided to arrange for a wholesale exhibition of American cars at the foreign shows of next year, to be participated in by all the members of the A. M. C. M. A.

Suggestion for 1908 A. A. A. Tour

A meeting of the touring board of the A. A. A. was held in New York City on November 6, with Chairman Hower presiding. Mr. Hower stated that the board had compiled a mass of valuable information since its organization. It was the sense of the meeting that a special effort should be made by the incoming board to gather information as to garages and hotels together with their rates, and that this work should be pushed as rapidly as possible, so that the information may be on file for the 1908 touring season.

Many suggestions were made for next year's annual tour. The idea that met with the greatest approval was that of selecting a central point between Chicago and New York, and having the tour start from that city and finish there each day.

The tenth annual automobile salon of France, at Grand Palais and Place Des Invalides, Paris, under the auspices of the Automobile Club of France, was opened by President Fallieres, on November 12. It is on a more magnificent scale than ever before, the electrical display both inside and outside of the palace being especially striking.

T. F. Moore, secretary of the Automobile Manufacturers' Committee in charge of the American International Road Race to be held in the spring, announces the following Executive Board and Rules Committee which has been appointed by Robert Lee Morrell: Col. George Pope, Hartford, Conn.; Henry Ford, Detroit, Mich.; E. R. Hollander, New York City; H. A. Lozier, Plattsburg, N. Y.; A. Massenat, New York City; C. A. Singer, New York City; Jas. Joyce, Providence, R. I.; Paul Lacroix, New York City; Hayden Eames, Cleveland, O.; F. P. Brand, Williamsport, Pa.; Walter Allen, New York City; F. B. Stearns, Cleveland, Ohio. It is the intention of Mr. Morrell that this body frame the rules, fix the entry fee, definitely select the day in April when the race is to be held and take executive control of the meet.

"Nothing Succeeds Like Success"

At a time like the present when there is a feeling of unrest, and yet all acknowledge that the country is in truly a prosperous condition, the present state being largely due to the uncontrolled speculation of comparatively few, the wise members of the automobile industry redouble their efforts to bring themselves before the public. Makers who are now able to put themselves more prominently to the front will undoubtedly reap a much larger percentage of profit for their outlay, than at any other time. The very inactivity of their competitors opens the way for much more pronounced results from every dollar invested in legitimate publicity.

The old adage "Nothing succeeds like success" is still true and those who now push to the front will immediately be recognized as the successful, sound, conservative and progressive manufacturers. The companies who show that they are not afraid and now increase their efforts, add immediately to the weight tending to restore to equilibrium, the disturbed balance of public confidence and at the same time, mark themselves, in the eye of the buying public, as the most reliable and dependable makers. Those who hesitate and hold back will find themselves greatly injured by their inactivity and entirely distanced by their less fearless competitors, who grasp just such opportunities to get the added publicity offered by the retirement of the others.

SPECIAL NOTICE

We are now revising and correcting the 8th Annual "Buyers' Guide," which will appear in the January number of the CYCLE & AUTOMOBILE TRADE JOURNAL. If you have not returned the "pink sheet" sent you duly corrected, do so promptly. If you have not received one of these pink sheets and are manufacturing anything for the trade, advise us promptly, giving full particulars of your product.

American Improvements Cause Drop in Foreign Car Prices

The recent drop in the prices of several of the best known foreign machines which are being sold in the United States has caused considerable comment. This move on the part of the importers is what should be expected at this time, and is the inevitable result of the marked improvement which has been made in the American product within the last few years. American makers of high-priced cars have gradually increased both the price and the manufacturing expense by the liberal use of alloyed steels, high grade ball bearings and other high quality materials. In the words of one of the best known importers, "There can be no doubt that the best types of American cars have shown remarkable improvement during the last two years. The prices on imported automobiles have in many instances been too high, in some cases fancy prices have been asked and paid for European machines. The day is past when, with the American product increasing in worth, the importer can point to such marked differences as will warrant these exceedingly stiff prices. The result is that there is a shrinkage in his ambitions in the price line, and a tendency to meet the American cars or come as near it as the extremely fine material and workmanship of the foreign machines will permit." This statement of the case from one of the leaders of the importers seems very close to the truth. The time is indeed past when fancy prices will be paid for imported machines, which, even acknowledging the fine material and workmanship put into them, are not at the present time in anyway superior to the best American-made cars, and, furthermore, are not as well adapted to our road conditions.

Hosted by Google

ers is, then, the first public acknowledgment by the foreign makers that the American automobile has reached a stage of perfection which makes it a close competitor even to the very highest grade foreign machines, upon which type of machine the foreign makers have largely concentrated their efforts; while it is well known that the American builders have perfected to a greater extent the small light weight and low cost, but serviceable car. In the manufacture of the latter type of vehicle the foreign makers are not yet able to compete with us. This, then, shows the remarkable advance of the American makers in the last few years in the entire line of automobile construction, and the time cannot be far distant when it will be difficult to sell the highest priced foreign machines in any quantity in this country, even if the original price is the same as that asked for the best American-made machines, because in every case considerable increase in price must be made owing to the duty.

The importers this year for the first time will hold a show in Madison Square Garden, New York, in the endeavor to impress the American public with the number and importance of the foreign cars in this country.

Need for Motor Starting Devices

The present tendency in automobile design is toward the use of better material and increased refinements in construction. This refining process has been steadily continued until the up-to-date high-grade car is a compact, well-built, serviceable and reliable piece of mechanism, yet in spite of the numerous improvements of nearly all the details one glaring crudity still remains, and paradoxial as it may appear this crudity owes its continuance to the other refinements. Altho nearly everything has been done to make the present motor car comfortable, convenient and even luxurious, we daily witness the spectacle of a well-dressed owner stepping out into the street, often into the mud, and ignominously turning a crank, like the proverbial hand-organ grinder, before he can enter his superbly equipt and much refined car. The rear entrance tonneau was very soon discarded, largely because it necessitated walking into the street to enter the car, and it is certainly time that the even more antiquated starting crank, which is not only inconvenient, but even dangerous, should also be relegated to the past.

Refinements in motor construction are largely the cause of the continued use of the starting crank. The introduction of the four-cylinder motor and refinements in cylinders, pistons, rings, and ignition apparatus, made it possible to start on the spark. This occurred just at the period when attention was being given in some quarters to positive motor starting devices, and it was immediately said that the motors were now sufficiently self-starting not to require any special starting devices. With the coming of the six-cylinder motor, with its high percentage, when in good condition, in regard to starting on the spark, another setback was given the introduction of motor starting devices. Nevertheless, in spite of all these improvements, the fact still remains that many times even the best multi-cylinder engines have to be cranked, and this menial operation is even harder to perform on these large four- and six-cylinder cars than it used to be on the smaller models. Why are car motors left running at the curb side when this is not necessitated by the weather? Simply because the driver or owner dislikes to crank the engine, there is no other possible excuse.

Automobiles are being operated in constantly increasing numbers by women, and the cranking of the motor is still one of the objectionable features, and deters many an otherwise proficient driver from daily using a machine. It is certain that the family horse will never be eliminated as long as the starting crank remains.

Aside from the question of mere convenience, now that the gasoline truck and light delivery wagon are coming prominently to the front, the need of self-starting devices is even more pronounced, as their introduction means time and money saved, and is a business necessity. It has been variously estimated by large users of gasoline commercial vehicles that their trucks are on an average standing idle at the curb or in blockades from one-third to one-half of the time, according to the length of haul and number of stops. In nearly every case the truck driver rather than crank the motor will let it run idly while making a delivery, and even for longer stops when unloading. This practise not only is an absolutely needless waste of fuel, but unnecessarily heats and wears out the mechanism.

Altho the fuel used in any one instance or trip is comparatively trifling, yet when continued for an entire season, the waste is decidedly appreciable. Assuming that during a ten-hour day the motor runs idly on an average about four hours, this is approximately 100 hours a month, or in a season of eight months' service the motor is run idle 800 hours, which is equivalent to running it continuously and uselessly for 80 working days of ten hours each.

From the foregoing facts it will be seen that altho the antiquated method of starting a motor by cranking may be tolerated on a pleasure car, it should not be on a commercial vehicle, where it is more or less of a necessity, and such devices should be demanded, and doubtless will be, in the near future, by commercial car purchasers.

BODY CONSTRUCTION

Probably at no previous show of
kind has there ever been seen fine
more costly vehicle bodies. In many
stances, condensed into the small s

Digitized by Google

construction ornamentation and equipment. The colors are not as pronounced or as contrasty as in former years, altho much untufted enameled red leather is in evidence, in fact the tufted upholstery is largely giving place to the cleaner and neater with finish of the untufted leather. Particularly in the fittings have the makers designed and equipt with apparent disregard of expense. Straight line body designs largely predominate and the increase of enclosed body designs is very noticeable. It is in the latter that the most luxurious fittings are found.

One car was finished in hand tooled leather, ornamented by dainty colored lacquer and gold leaf, and so royally fitted that it might well be the equipage of a medieval monarch, yet this is but a regular stock model.

Even in the small comparatively low priced machines the workmanship and finish are much better than in previous years. The small enclosed town car which has previously been confined almost exclusively to the electrics has now entered the gasoline field and will undoubtedly be made in large numbers this season.

The coweled dash is now confined almost entirely to high powered runabouts, the front boards of the touring cars being usually plain boards of mahogany with brass beaded edges. All the dashes are freer of mechanism and there is a notable decrease in the number of sight feeds of the oiling system on the dash.

The wheel hubs are gradually being flattened to reasonable proportions, instead of protruding to even a dangerous degree as in some past models. The fenders are vastly superior this year being not only more substantial, but much more graceful in outline. In nearly every instance splash shields either of metal or enameled leather web the space between the guard proper and the body. These in conjunction with the liberal length under pans make it impossible for the flying dirt to strike the body, sides or passengers. Double rumble seat and rear convertible seats are rapidly increasing in number in the runabouts.

SMALL MECHANICAL DETAIL CHANGES.

The steering gears are noticeably more sturdy and several cars show the longitudinal steering link and steering pivot arm above and behind the front axle, well protected from road obstructions. The spark and throttle levers on the hand wheel are in many cases friction retained in place of the use of the stationary notched sector. The leakage at the lower end of the column to the carburetor and timer are better made and provided with bell joints. Half height doors at the front are largely used, a few being stationary, sides protected from foot scratching by decorated or monogramed leather pads. The floor boards and run boards are as a rule either aluminum or pyramid rubber.

One well-known maker shows a double fly-wheel engine, a small one being used at the front and the remainder of the necessary fly-wheel weight being carried as usual at the rear. The arrangement tends toward lessened torsion in the crank shaft and flexibility.

SPRINGS

The springs do not show much change, except better provisions are made for spring eye oiling, and the fastenings are more secure, the spring clips being in some cases webbed together as shown in the sketch.

AUTOMOBILE TRADE JOURNAL

Shock absorbers are largely used, more being fitted by the makers than in previous years. In the case of platform springs the method of supporting the rear cross spring is much more substantial than in former years. One method is illus-

AUTOMOBILE TRADE JOURNAL

trated herewith. The rear cross frame member is carried outward to the rear at the center and supports the center of the cross spring being rigidly braced by diagonal bars, greatest depth in a vertical plane.

INTRODUCTION OF GUN METAL FINISH.

This show marks the real beginning of the use of dark finished lamps, radiators

Hosted by Google

and steering posts. Gun metal finish as shown on the parts usually of highly polished brass of several high priced models. That there will be an extended use of this dark finish is unquestionable as it is not only serviceable, and saves unnecessary labor, but in addition it does not cast an unpleasant glare in the eyes of the driver or occupants and is with all very handsome in appearance.

Square pattern side lamps have entirely superseded the bullet forms.

IGNITION.

Nearly all the high priced cars are now equipt with two distinct ignition systems and in most cases one of these includes a high tension magneto, many more of these being furnished as part of the regular equipment than ever before. The shaft drive is shown in overwhelming numbers and of the double side chain driven cars several are fitting chain guards.

BRAKES AND EQUALIZERS.

Nearly all brake rods have interposed equalizers, these being of the single tree type with variations, these solid rod constructions having almost entirely displaced the so prevalent former use of cable. In the accompanying drawing is shown one new form consisting of a yoke shaped single tree piece, the ends of which operate cross shafts supported on a cross frame member, the ends of the cross shafts carrying short arms connected by rods to the rear wheel brakes. All the car brakes are of increased size and both sets located on the rear wheel drums, the transmission brake being shown in only a few instances.

AUTOMOBILE TRADE JOURNAL

Motor governors seem to have almost entirely disappeared, altho one well-known firm shows a new diaphram governor connected to the cooling water system. The fans are more and more being positively driven by gears with a small friction device interposed to prevent breakage. Nearly all are supported on the motor base, and almost none on the radiator frame. Fans still using belts are fitted with flat ones or round ones of coiled wire.

CARBURETORS.

There are not so many new carburetors shown by the accessory makers, but there are numerous changes being made in the carburetors made by car manufacturers and supplied on the 1908 models. A few show new multiple jet types, while many have changed the design to that of an annular float with central gasoline nozzle which is unaffected by the angle at which the carburetor stands.. More are regulating the nozzle opening simultaneously with the throttle and water jacketing the mixing chamber, and most are arranged to take either warm or cold air. More care is shown in the placing of screens and the location of the intake to the carburetor to prevent the entrance of dirt. One carburetor is provided with a muffler over its intake pipes to prevent the whistling sound of the air. Priming devices are not as much in evidence as formerly, but one company has placed a very small hand plunger air pump as shown on the forward end of the right side frame member, a couple of strokes of which will depress the carburetor float sufficiently to flood the instrument.

AUTOMOBILE TRADE JOURNAL

The bearings are largely of the annular non-adjustable ball type, and are used freely thruout the constructions. Ball bearing crank shafts and cam shafts being numerous. Many are also using ball bearing steering pivots.

The show this year included a very complete list of exhibitors, in spite of the fact that the importers were not included, the list shows over 300 exhibitors as compared to 255 at the January show of last year.

Thirty-one different makes of gasoline cars, eight makes of electrics, thirteen commercial vehicles, and one make of steam car were shown, in addition to fifteen makes of motorcycles and 211 accessory exhibits. Eleven six-cylinder models varying in price from $3500 to $6500, and in horse power from 42 to 70 were exhibited, a large increase in the sizes over last year.

In regard to the show date a definite expression of opinion as to whether it is too early, has not been given, and owing to the financial situation can probably not be given. The setting of the date for the next show however will show the feeling of the A. L. A. M.

One of the features of the early shows this year was the number of automobilists that toured to the show, and it will even be more popular next year, provided the makers continue to promote early shows.

Hosted by Google

held in Chicago a monster triple build- exhibit, the only really representative omobile show in this country, as it l be held under the auspices of the Na- nal Association of Automobile Manu- turers, Inc. Here will be gathered to- her not only the licensed and unli- sed motor car makers, but by far the gest and most complete exhibit of ac- sories by the motor and accessories nufacturers that has ever been seen in s country. In addition a department l be devoted exclusively to motor- les, the little fellows who are surely tined to play in the near future an im- tant part in the motor-propelled vehi-

held, was formerly known as Tattersa and is located at Sixteenth and Sta streets, four blocks from the Colise and First Regiment Armory. It is 3 feet long and 153 wide. There is not post in the entire building.

Every form of motor-propelled comme cial vehicle, and, in addition, farm impl ments, fire department wagons and oth novelties will be shown, thirty-two co panies being represented.

The other two buildings which w house the pleasure vehicles are the we known Coliseum on Wabash avenue a the First Regiment Armory. The magn tude of the show can be grasped from t

The Coliseum, Wabash avenue, Chicago, where a large part of the exhibits of the Chicago venth National Annual Automobile Show will be on view. Additional space has this year been de available in the basement where will be housed about 20 car exhibits and 40 exhibits of cessories.

industry of our country. For the first e a comprehensive exhibit of commer- vehicles occupying an entire building be shown.

his will be known as the First An- l Exhibition of Commercial Motor icles. While it is, in some respects, a t of the old show, it was thought wise give it a distinct title, thus marking time when the commercial car as-

fact that there will be more automobi exhibitors than at the combined Ne York shows, and that there will be ov fifty accessories makers not represent at either of the Eastern exhibits. Th combined floor space will aggregate 16 067 square feet, which makes this th largest show of its kind yet held in Ame ica.

At the time of this writing it is stat

The 1st Regiment Armory, Chicago, where part of the Seventh National Annual Automobi
how will be held November 30-December 7, 1907. The combined floor space of the three buildin
or this show is 165,067 square feet, more than in any previous automobile show held in th
ountry.

the space, have been transferred to a parate building. The entire gallery of e Coliseum and second floor of the an-x, except the motorcycle section, have en taken by members of the Motor and ccessories Manufacturers, Inc.

DECORATIONS.

The plan of decoration and equipment ll be even more elaborate than last ar. Among other features there will be 2 oil paintings, ranging in size from four by eight to eight by twenty-four f covering, in all, 873 square feet of c vas. These pictures represent, in ma cases, scenes in which the cars exhibi in the immediate neighborhood h taken part. Others show American ca photographed in all parts of the wo Every picture represents some actual currence. Racing pictures will be giv a place, the subjects including the twen four hour races at Morris Park and

Digitized by Google

Brookfields track, in England; a race on the Detroit track, and two scenes at the Vanderbilt cup race of 1906.

The motorcycle seems to have assumed a position of such importance as to demand considerable attention. A section in the second floor of the Coliseum annex has been devoted to it and ten manufacturers have taken advantage of the opportunity presented. The list includes all the leading makers of the country. This is not, as a matter of fact, the first year attention has been given to the motorcycle, as has been stated, for they have formed a feature of the Chicago show for three years. But it is the first time they have been given a place by themselves.

ADMISSION.

For the first time at Chicago the price of admission will be raised on Wednesday and Thursday. The crowds attending the show for the last four years have been so dense that it has been a difficult matter for investigators to get the attention to which they were entitled. The change in price of admission is designed to give these people breathing space and a chance to make an examination of the new models without overcrowding, and to afford the attendants an opportunity to give them the necessary time for proper instruction. The admission fee on the other five days will be 50 cents, as heretofore.

One price will entitle the visitor to admission to all of the buildings. It is not intended, however, to so crowd the commercial exhibit as to prevent proper investigation by persons genuinely interested. The management feels that it is due to the exhibitors in this department to afford the interested, investigating visitor every opportunity to secure all the information he desires.

Visitors to the Coliseum who are sufficiently interested to make the request, will be given tickets of admission to the commercial show without charge. Invitations, containing season tickets, have been mailed to members of the Illinois Manufacturers' Association and merchants in all parts of the country, and every effort is being made to secure the attendance of persons who are interested. The exhibitors have each been furnished as many invitations as needed for distribution among prospective customers and those interested.

The show will open as usual at 2 P. M. on Saturday, November 30, and each day thereafter, except Sundays, at 10 A. M., and will close at 10.30 P. M.

Summaries of Exhibits

The following is a list of the cars and parts exhibited, with brief specifications and references to the place where complete descriptions will be found:

ACME MOTOR CAR CO., Reading, Pa., about the same as exhibited at the recent New York Show; type 20, Sextuplet, $4500; Sextuplet limousine, 7-passenger, $5500; type 18, touring car, $4000; the new Sextuplet described in this issue.

AEROCAR MOTOR CO., Detroit, Mich., Model "D," 4-passenger, light touring car, 4 cylinders, 4x4, 20 H. P., three speeds forward and reverse, sliding gear, shaft drive, wheel base 104 inches; price, $1500; Model "E," 3-passenger car, motor same bore and stroke, but air-cooled, wheel base 105 inches; price, $1500; Model "F," 5-passenger touring car, 4 cylinders, 5x5 inches, 40 H. P., same general specifications; price, $2200.

ALDEN-SAMPSON MFG. CO., Pittsfield, Mass., same as exhibited at the recent New York Show, consisting of a gasoline-electric road train. Described in this issue.

AMERICAN LOCOMOTIVE AUTOMOBILE CO., 1886 Broadway, New York City; factory, Providence, R. I., 4 models; a 6-cylinder, 60 H. P. chassis, 4¾x5½, sliding change speed gear, selective operation, side chain drive, 126-inch wheel base, fitted as a touring car or runabout, $7500; with limousine body, $8500; a 40 H. P. car with combination body, 4 cylinders, 4¾x5½, sliding change speed gear, selectively operated, 4 speeds forward and one reverse, direct on both third and fourth, 126-inch wheel base; price as a touring car, $6500; with limousine body, $7500; 22 H. P. town car, 4 cylinders, 4x4¾, general chassis arrangements the same as in the 40 H. P. car, wheel base 112 inches; price, $6000; to be described in our next issue.

AMERICAN MOTOR CAR CO., Indianapolis, Ind., same as shown at the recent New York exhibit. To be described in our next issue.

AMERICAN MOTOR TRUCK CO., Lockport, N. Y., commercial vehicle, three tons capacity, with stake body, four cylinders, vertical, water-cooled motor, under driver's seat, 5x6, 40 H. P., planetary change speed gear, two forward and one reverse, double side chains, wheel base 9 feet 8 inches; price, $4000. Described in this issue, page 286.

APPERSON BROS. AUTOMOBILE CO., in addition to the models shown at New York, a 30-35 H. P. shaft-driven touring car, with a 5-passenger body. 1908 models described in our November, 1907, issue, page 78.

ATLAS MOTOR CAR CO., Springfield, Mass., the same 2-cycle line as shown at the recent New York exhibit. 1908 models described in this issue, page 104.

AUBURN AUTOMOBILE CO., Auburn, Ind., two models upon similar chasses. Model "G," 5-passenger touring car, 2-cylinder, opposed motor, under body, 5¼x5, 24 H. P., planetary change speed gear, 100-inch wheel base; price, $1350; a runabout with low, rakish body with rumble seat, same chassis; price, $1250. To be described in an early issue.

AURORA MOTOR WORKS, Aurora, Ill., gasoline touring cars.

AUSTIN AUTOMOBILE CO., Grand Rapids, Mich., Models LX-L, LX-R, XC-T and XC-R, as shown at the recent New York exhibition. These cars range in price from $4500 for the LX-T touring car to $7000 for the XC-C 6-cylinder touring car, which latter model is not shown, however, at Chicago. 1908 changes to be described in an early issue.

AUTO CAR CO., Ardmore, Pa., same models as shown at the recent New York exhibit. 1908 cars described in our November issue, page 156.

BABCOCK ELECTRIC CARRIAGE CO., Buffalo, N. Y., in addition to the models shown recently in the New York Show, a 4-passenger coupe, inside driven; 40-cell battery, half in front in the hood and half in the rear, two 3 H. P. motors, capable of 300 per cent. overload, operated from the left hand side by side levers, 4 passengers, or 5, if necessary, can be accommodated; price, $3000. To be described in an early issue.

BAKER MOTOR VEHICLE CO., Cleveland, O., same models as at the recent New York exhibit. To be described in an early issue.

BARTHOLOMEW CO., THE, Peoria, Ill., the same types as shown at the recent New York exhibition. Described in our November, 1907, issue, page 96a.

Hosted by Google

BRUSH RUNABOUT CO., Detroit, Mich., same as shown at the recent New York exhibition. 1908 changes described in this issue.

BUCKEYE MFG. CO., Anderson, Ind., in addition to the cars exhibited at the recent New York Show, Model "S," 2-cylinder, opposed motor, 6x4½, 24 H. P., seating capacity five, 94-inch wheel base; price, $1275. 1908 models described in an early issue.

BUGMOBILE COMPANY OF AMERICA, 208 Wabash avenue, Chicago, Ill., motor buggy, Model B, passenger capacity two, two-cylinder, opposed motor, under seat, 4x4, 12 H. P., patented chain and sprocket, change speed gear with clutch between high and low, giving two speeds and one reverse, chain cable drive, wheel base 75 inches; price, $650. To be described in an early issue.

CADILLAC MOTOR CAR CO., Detroit, Mich., the same complete line of pleasure vehicles as shown at the recent New York exhibit. 1908 models described in our November, 1907, page 88.

CHICAGO COACH & CARRIAGE CO., 1223 Michigan avenue, Chicago, Ill., Model "A" runabout, passenger capacity three, two-cylinder, opposed motor, 4x4, 10-12 H. P., special selective change speed gear, consisting of three bevel gears and two pinions, two speeds ahead and one reverse, cable drive to rear wheels, wheel base 65 inches; price, $750. To be described in an early issue.

CLEVELAND MOTOR CAR CO., New York, same as shown at the recent New York exhibition. 1908 features described in this issue.

COLT RUNABOUT CO., 1548 Michigan avenue, Chicago, Ill., about the same as shown at the recent New York exhibition, consisting of the Colt 6-cylinder runabout, described in our August, 1907, issue, page 96.

COLUMBUS BUGGY CO., Columbus, O., the same as shown recently in New York. To be described in an early issue.

COMMERCIAL MOTOR TRUCK CO., Plymouth, O., commercial vehicle or sight-seeing body on same general chassis; Model "G," 20-passenger capacity, four-cylinder, water-cooled motor, under driver's seat, 4¾x5, 40 H. P., friction transmission, giving two to twenty miles per hour, double side chains, 103-inch wheel base; price, $2250. With this special friction transmission no differential is required. Described in this issue, page 276.

CONTINENTAL MOTOR CAR CO., 785 Jackson Boulevard, Chicago, Ill.

COPPOCK MOTOR CAR CO., Decatur, Ind., one commercial truck, Model "A," capacity 1 ton, 2-cycle motor, 2 cylinders, bore 4½x5 inches, stroke 5 inches, under the driver's seat, H. P. 20-24, progressive change speed gear, three forward and one reverse, double side chains, wheel base 87 inches; price of chassis, $2500. To be described in an early issue.

CORBIN MOTOR VEHICLE CORP., New Britain, Conn., same as shown at the recent New York exhibition. 1908 models to be described in our next issue.

CORNISH-FRIEDBURG MOTOR CAR CO., 1233 Michigan avenue, Chicago, Ill., "C-F" touring cars, 4 cylinders, 4¼x4¾, Ball planetary change speed gear, wheel base 108 inches. Described May, 1907, page 68.

COUPLE-GEAR FREIGHT WHEEL CO., Grand Rapids, Mich., an exhibit of electric commercial vehicles with four wheel drive of the couple-gear system. To be described in our next issue.

C. V. I. MOTOR CAR CO., Jackson, Mich.

DAYTON MOTOR CAR CO., Dayton, O., in addition to the cars exhibited in New York, Model 8-T, 6-cylinder roadster, 4⅝x6, 50-60 H. P., seating capacity 2, 3 or 4; price, $3750. To be described in an early issue.

DE LUXE MOTOR CAR CO., THE, Detroit, Mich., two touring cars and a polished chassis, same as exhibited at the recent New York Show. Described in this issue, page 199.

DIAMOND T AUTO CO., 3 Huron street, Chicago, Ill., Diamond T touring car and runabout.

DOLSON AUTOMOBILE CO., Charlotte, Mich., two models, H. and F; Model F, seven-passenger touring car, 4 cylinders, 5x5¾, 60 H. P., selective sliding change speed gear, three speeds forward and one reverse, shaft drive; price, $3250; Model H, five-passenger touring car, 4 cylinders, 4½x5¼, wheel base 115 inches; other specifications similar to Model F, weight 2700; price, $2500.

DRAGON AUTOMOBILE CO., Philadelphia, Pa., same models as shown recently in New York. To be described in an early issue.

ELECTRIC VEHICLE CO., Hartford, Conn., Mark 66-3, the combination gasoline and electric seven-passenger car, chassis fitted with touring car and limousine bodies. The transmission is electrical, no gears being used; in fact, the engine is not in any way connected mechanically with the driving shaft. These vehicles were shown at the recent New York exhibition. Described in our November, 1907, issue, page 70.

ELMORE MFG. CO., Clyde, O., same as exhibited at the recent New York Show, consisting of its line of well known two-cycle, three and four-cylinder models. 1908 changes to be described in an early issue.

FRANKLIN MFG. CO., H. H., Syracuse, N. Y., the same line of air-cooled cars as shown at the recent New York exhibit. 1908 changes described in the October, 1907, issue, page 168.

GAETH AUTOMOBILE WORKS, Cleveland, O., same as shown at the recent New York exhibition. 1908 models described in November, 1907, issue, page 87.

GEARLESS TRANSMISSION CO., Rochester, N. Y., three models, friction driven, the same as exhibited at the recent New York Show. Described in our September, 1907, issue, page 118.

GENERAL VEHICLE CO., Broadway and Sixty-second street, New York City.

GIFFORD-PETTIT MFG. CO., 720 Devon avenue, Chicago, Ill.

HATFIELD MOTOR VEHICLE CO., Miamisburg, O., same as shown at the recent New York exhibition. 1908 models described in the November, 1907, issue, page 144.

HAYNES AUTOMOBILE CO., Kokomo, Ind., the same models as shown at the recent New York exhibit, the 1908 models being described in our March, 1907, issue, page 215.

HOLSMAN AUTOMOBILE CO., Chicago, Ill., the same models as shown at the recent New York exhibit, and in addition the new limousine model motor, 2 cylinders, opposed, under the body, seating capacity 2, cylinders 4x4, 12 4-5 H. P., air-cooled. This car is fitted with a special enclosed limousine type of body. 1908 models practically unchanged, referred to in our February, 1907, issue, page 262.

IMPERIAL MOTOR CAR CO., Williamsburg, Pa., the same as shown at recent New York exhibit; one 30-35 H. P. chassis, and the same fitted with four individual bucket seats; price, $2650, and with folding rumble seat and runabout body, $2500. Described in this issue.

JACKSON AUTOMOBILE CO., Jackson, Mich., in addition to the cars shown in New York, Model F runabout for two; 2-cylinder motor, 5x4 inches, horizontal, under the hood, water-cooled Thermo-Syphon circulation, planetary change speed gear, two speeds forward and one reverse, 90-inch wheel base; price, $850, or $900 with top. 1908 models with the exception of this latest Model F, described in our November issue, page 83a; Model F to be described in an early issue.

JEFFERY & CO., THOMAS B., Kenosha, Wis., Model "Thirty-four," medium weight, five-passenger touring car, four-cylinder, vertical motor, 4½x4½, 32 H. P., sliding change speed gear, selective operation, three speeds forward and one reverse, shaft drive, 112-inch wheel base; price, $2250; Model "Thirty-four" touring roadster, passenger capacity 3, 4 cylinders, vertical, 4½x4½, same general features, but touring box and rumble seat removable, leaving a large deck for storing baggage; price, $2250; Model "Thirty-one" utility car, capacity five passengers, two cylinders, opposed, under the body, 5x6, 22 H. P., planetary change speed gear, two forward and one reverse, single chain drive, 106-inch wheel base; price, $1400. This machine is equipt with detachable tonneau and torpedo deck to be used in place of the tonneau will be furnished for $25 additional, or car will be furnished with the deck, without tonneau, at $1300. Described in our November, 1907, issue, page 79a.

KISSEL MOTOR CAR CO., Hartford, Wis., practically the same as exhibited at the recent New York Show, consisting of a limousine, touring car, roadster, and polished chassis. Described in our October, 1907, issue, page 164.

KNOX AUTOMOBILE CO., Springfield, Mass., the same as shown recently in New York. To be described in our next issue.

LARSEN ICE MACHINE CO., 315 Dearborn street, Chicago, Ill., gentlemen's speeding car, six-cylinder motor, 4⅞x5½ 120 H. P., sliding change speed gear, three speeds forward and

Hosted by Google

one reverse, located in the rear axle, shaft drive. This machine is special thruout, and is built only to private order, direct from purchaser. It is most luxuriously fitted, all the bright portions being quadruple, silver plated. It is geared 2½ to 1 with 40-inch wheels, and weighs but 2700 pounds, and it is claimed with its 120 H. P. it can easily do two miles per minute. Price, $7500. To be described in an early issue.

LAUTH-JERGENS MOTOR CAR CO., 94-98 Rawson street, Chicago, Ill., Lauth-Jergens 4-cylinder touring car, 5x5 inches, selective transmission, partly by sliding gear and partly by lug clutches. To be described in an early issue.

LEAR AUTOMOBILE CO., OSCAR, Springfield, O., 2, 3 and 4-passenger air-cooled cars, as shown at the recent New York exhibition. 1908 changes to be described in an early issue.

LOCOMOBILE COMPANY OF AMERICA, Bridgeport, Conn., the same as shown at the recent New York exhibit. Described in our August, 1907, issue, page 56.

LOGAN CONSTRUCTION CO., Chillicothe, O., the same as exhibited at the recent New York Show; the latest models were described in our issue of November, 1907, Model "R" delivery wagon, on page 278, and Models "S" and "T" on page 288.

LORRAINE AUTOMOBILE MFG. CO., 1812 Twenty-second street, Chicago, Ill.

LOZIER MOTOR CO., 396 Wabash avenue, Chicago, Ill., Models G, H and I, Model G limousine, 7-passenger, 4 cylinders, 4⅝x5½, 40 H. P., selective sliding change speed gear, 4 speeds forward and one reverse, double side chain drive, wheel base 117 inches; price, $5000; Model H, 7-passenger touring car, 4 cylinders, 5¼x5¼, 45 H. P., same chassis arrangement, but 124-inch wheel base, $5000; Model I touring car, 6 cylinders, 4⅝x5½, 50 H. P., same general specifications, but 131-inch wheel base, $6000.

MATHESON MOTOR CAR CO., Wilkesbarre, Pa., same as at the recent New York Show. 1908 models described in this issue.

MAXWELL-BRISCOE MOTOR CO., Tarrytown, N. Y., the same models as shown at the recent New York exhibition, the 1908 models being described in this issue, page 192.

MEISELBACH MOTOR WAGON CO., A. D., North Milwaukee, Wis., two commercial vehicles; Model A, 1-ton chassis, two cylinder, opposed motor, 6x4½, located under the seat, 28 H. P. Friction change speed gear, known as a double bevel friction drive, giving speeds from one to ten per hour or greater if desirable, double side chains, wheel base 96 inches; price of chassis, $2000; Model B, two-ton brewery bottle wagon, with sliding doors, and also a Model B chassis, fitted with a sight-seeing body of 14 passengers capacity. The bevel drive of these machines obviate the necessity for a differential. Described in our October, 1907, issue, page 228.

MITCHELL MOTOR CAR CO., Racine, Wis., in addition to the cars shown at the recent exhibit in New York, a Mitchell truck with open body and the same chassis fitted with an enclosed laundry type of body, will be shown; the motor is four cylinders, vertical, 20 H. P., three speed and one reverse, sliding gear change speed, worm drive, wheel base 110 inches; price, $2000. The pleasure cars were described in our November, 1907, issue, page 108, and the truck in November, 1907, page 275.

MOLINE AUTOMOBILE CO., East Moline, Ill., three models, A, S and H, as shown at the recent New York exhibit. 1908 models described in the November, 1907, issue, page 93a.

MOON MOTOR CAR CO., St. Louis, Mo., same as exhibited at New York; Model C, 5-passenger, 30-35 H. P., 4½x4½, 4 cylinders, 110-inch wheel base, 4 speeds forward and reverse by sliding selective change speed gear, shaft drive; price, $3000; roadster seats 3 or 4 persons, same chassis, shaft drive, $3000; Model D, seats 7 persons, 4 cylinders, 4¼x4½, same general chassis specifications, except 121-inch wheel base; price, $3750.

MONARCH MOTOR CAR CO., Chicago Heights, Ill., two gasoline models, touring car, passenger capacity 5, 4-cylinder motor at the front, 4¾x5½, 40 H. P.; price, $2000; runabout, with the same motor, with double rumble seat; price, $1750. To be described in an early issue.

NATIONAL MOTOR VEHICLE CO., Indianapolis, Ind., same as exhibited at the recent New York Show, described in this issue.

NORDYKE & MARMON CO., Indianapolis, Ind., the same models as shown at the recent New York exhibition. The changes in the air-cooled motor were described in our November issue, page 142. The water-cooled model will be described in an early issue.

NORTHERN MOTOR CAR CO., Detroit, Mich., the same cars as exhibited recently in New York. 1908 models described in this issue.

OAKLAND MOTOR CAR CO., Pontiac, Mich.

OLDS MOTOR WORKS, Lansing, Mich., the same models as shown at the recent New York exhibit. 1908 models described in our November issue, page 90.

PACKARD MOTOR CAR CO., Detroit, Mich., same as shown at New York. Described in the July, 1907, issue, page 64.

PEERLESS MOTOR CAR CO., Cleveland, O., two models; Model 18 with touring limousine and roadster bodies, and Model 20, six-cylinder car, the same as exhibited at the recent New York Show. 1908 models described in November, 1907, issue, page 101.

PIERCE CO., GEORGE N., Buffalo, N. Y., four models. two six-cylinder touring cars, a four-cylinder touring car, and the same chassis with the suburban body and a small six, polished chassis, the same as exhibited at the recent New York Show. Described in this issue, page 120.

PIERCE ENGINE CO., Racine, Wis., same as shown at the recent New York exhibition. To be described in an early issue.

PITTSBURG MOTOR VEHICLE CO., 110 W. Thirty-fourth street, New York City, two models, both electric delivery wagons, driven by Westinghouse motors. Type 1 has a capacity of 750 pounds, and is driven by a single chain, has a wheel base of 75 inches. The price is $1875. Type 2 has 1500 pounds carrying capacity, is driven by double side chains, has 85-inch wheel base, and sells for $2625. To be described in an early issue.

POPE MFG. CO., Hartford, Conn., same as shown at the recent New York exhibit, consisting of Model M runabout and touring car, Model R touring car, Model X runabout, and X touring car. Model M, passenger capacity 2, 3 or 4. 4 cylinders, 30 H. P., selective sliding change speed gear, wheel base 109 inches; touring car the same general specification, wheel base 112 inches; price, $2750, same as the runabout; Model R touring car, passenger capacity 5, 4 cylinders, 25 H. P., progressive change speed gear, shaft drive, 102-inch wheel base, $2500; Model X runabout, passenger capacity 2, 4 cylinders, 20 H. P., progressive sliding change speed gear, wheel base 95 inches, $1750; Model X touring car, to seat 4, same specifications and price. To be described in our next issue.

POPE MOTOR CAR CO., Hartford, Conn., same as exhibited at the recent New York Show. To be described in our next issue.

PREMIER MOTOR MFG. CO., Indianapolis, Ind., three models, the same as exhibited at the recent New York Show. To be described in an early issue.

PULLMAN MOTOR CAR CO., Tacoma Building, Chicago, Ill., Model "15," Pullman "Flyer," seven-passenger touring car, four cylinders in front, 5¼x5½, 55 H. P., sliding change speed gear, four speeds ahead and one reverse, direct on the third, shaft drive, 120-inch wheel base; price, $4000. The motor and transmission are each on three point suspension, and five brakes are used for mountain travel. To be described in an early issue.

PUNGS-FINCH AUTO & GAS ENGINE CO., Detroit, Mich., two models, Model "H," five-passenger touring car, four-cylinder, vertical, water-cooled motor, 4½x5, 28-32 H. P., sliding change speed gear, selective operation, three speeds and one reverse, the second and third speeds are obtained by interlocking dogs in place of sliding gears, 106-inch wheel base; price, $2500. Model "35" runabout, with folding rumble seat, four cylinders, vertical, 4¾x5, same transmission, shaft drive, 106-inch wheel base; price, $2500. To be described in an early issue.

RAINIER MOTOR CAR CO., Broadway and Fiftieth street, New York City; factory, Saginaw, Mich., the same line of cars as shown at the recent New York exhibit. To be described in an early issue.

RAPID MOTOR VEHICLE CO., Pontiac, Mich., a large commercial car exhibit, consisting of Models E 182, 132, 125, 21, 85, 202 and 194, as shown at New York. The 1908 changes will be described in an early issue.

RAUCH & LANG CARRIAGE CO., Cleveland, O., complete line of electric pleasure vehicles. Described March, 1907, page 225a.

Hosted by Google

RELIANCE MOTOR CAR CO., Detroit, Mich., same as exhibited at the recent New York Show, consisting of 2 to 5 -ton 2-cycle trucks and commercial cars. To be described in an early issue.

REO MOTOR CAR CO., Lansing, Mich., same as exhibited at the recent New York Show. 1908 models described in November, 1907, issue, page 176.

ROYAL MOTOR CAR CO., Cleveland, Ohio, same as at the recent New York exhibit. To be described in an early issue.

SAFIR AUTOMOBILE CO., Zurich, Switzerland.

SAYERS & SCOVILL, 2243 Colerian avenue, Cincinnati, Ohio, one commercial car, capacity 3000 pounds, air-cooled motor, under the seat, four cylinders, 4x4, 20-24 H. P., sliding change speed gear, three speeds forward and one reverse, double side chains, wheel base 100 inches; price, $2500. A special feature of this machine is the fact that no side levers are used. Described October, 1907, page 222.

SCHACHT MFG. CO., Cincinnati, Ohio, three models of high wheeled type with opposed motors, as shown at the recent New York exhibit. Described in our April, 1907, issue, page 136.

SHOEMAKER AUTOMOBILE CO., Freeport, Ill., touring car, Model "C," 4 cylinders, 4½x5¼, 35-40 H. P., selective sliding gear, 3 speeds forward and one reverse, shaft drive. Described in our September, 1907, issue, page 68.

SMITH AUTOMOBILE CO., Topeka, Kan., same as shown at the recent New York exhibition. 1908 models described in November, 1907, issue, page 77.

STAVER CARRIAGE CO., 76th and Wallace streets, Chicago, Ill., Model "D" buggy type with Stanhope body, passenger capacity two, motor, two-cylinders, opposed, at the rear, 5x5, 18-20 H. P., planetary change speed gear, two speeds forward and one reverse, double side chains, 78-inch wheel base, $1000. To be described in an early issue.

STEARNS CO., F. B., Cleveland, Ohio, in addition to the cars shown at the recent New York exhibit, a three-passenger runabout, $4500; a seven-passenger limousine, $5750; and a five-passenger landaulet, $5750. All with 4-cylinder motors, 5⅜x5⅞, 30 H. P., all being on the same, and only 4-cylinder chassis built by this company.

STEVENS-DURYEA CO., Chicopee Falls, Mass., same as shown at the recent New York exhibition. 1908 models to be described in our next issue.

STREATOR MOTOR CAR CO., Streator, Ill., touring car "C Halladay," passenger capacity 5 or 7, 4-cylinder, Rutenber motor, 4⅝x5, 35-40 H. P., sliding change speed gear, three forward and one reverse, shaft drive, wheel base 118 inches; price, $3000. To be described in an early issue.

STUDEBAKER AUTOMOBILE CO., South Bend, Ind., same models as shown at the recent New York exhibit, the 1908 models being described in this issue.

THOMAS MOTOR CO., E. R., Buffalo, N. Y., same as exhibited at the recent New York Show. 1908 models described in our October, 1907, issue, page 101. Six-cylinder and town car to be described in an early issue.

TINCHER MOTOR CAR CO., South Bend, Ind., four models on two chasses, seven-passenger touring car and three-passenger roadster of six and four cylinder type, the engines being under the hood, with bores of 4x6 and 5x6, 50 and 90 H. P., selective sliding change speed gear, four speeds ahead and one reverse, double side chains, wheel bases 110, 127 and 140 inches; prices, $5500, $6500 and $7500. Described in our September, 1907, issue, page 110.

WALTHAM MFG. CO., Waltham, Mass., the same as shown at the recent New York exhibit, consisting of Models DLR, 20 H. P., 4-cylinder, runabout; Model 18 H. P., single cylinder runabout; Model 29, 8 H. P., 2-cylinder, runabout; Model 158, 14 H. P., 2-cylinder, tonneau car; Model 188, 14 H. P., 2-cylinder, Democrat Wagon, described in this issue, page 95.

WAYNE AUTOMOBILE CO., Detroit, Mich., the same as shown at the New York exhibit, consisting of the Wayne "Thirty," with touring, tourabout and roadster bodies: also a polished chassis. Described in our November issue, page 148.

WAYNE WORKS, Richmond, Ind., two models, 4 cylinders, air-cooled, 3¾x4, sliding change speed gear, shaft drive; price without top, $1450; with top, $1525. Also a Model I, 5 or 6 passenger car, 4 cylinders, air-cooled, 4¼x4½, sliding change speed gear, selective operation, three speeds forward and one reverse, 106-inch wheel base. Described in November, 1907, issue, page 148.

WELCH MOTOR CAR CO., Pontiac, Mich., Models 6-L and 4-I, as shown at the recent New York exhibit. Price of the touring car is $6000 and for the limousine $5500. To be described in an early issue.

WESTERN TOOL WORKS, Galesburg, Ill., Model "K," 8, five-passenger touring car, two-cylinder, opposed, motor under body, 5½x5½. 30 H. P., planetary change speed gear, two forward and one reverse, single chain drive, 95-inch wheel base; price, $1250. The body on this machine is tilting, exposing the motor. Model 8, two-passenger runabout, two-cylinder, opposed, motor under hood, 4¼x4¾, 14 H. P., planetary change speed gear, two speeds forward and one reverse, bevel gear shaft drive, wheel base 85 inches; price, $1000. To be described in an early issue.

WHITE COMPANY, Cleveland, O., full line of steam pleasure vehicles, as shown at New York Show, and also an exhibit of the White commercial vehicles.

WINTON MOTOR CARRIAGE CO., Cleveland, O., identically the same exhibit as shown recently at New York, consisting of the different models of the Six-Teen-Six, described in our September, 1907, issue, page 132.

WOODS MOTOR VEHICLE CO., electric vehicles as follows: No. 214, with solid tires, $2100; 214 B, same chassis with additional seat, $50 extra; 214 A, four-passenger inside operated brougham; also the Victoria chassis. To be described in an early issue.

WORTH MOTOR CAR MFG. CO., Evansville, Ind., sight-seeing vehicles. Brief description March, 1907, page 232.

ACCESSORIES AND PARTS

The following accessory and parts makers are those who are exhibiting at Chicago, but did not exhibit at either of the New York Shows. The Chicago exhibits of those who were also at either or both of the New York shows will be the same as the New York exhibits and were summarized in the November 1907 Journal.

ARNSTEIN, EUGENE, Thirty-fifth and Shields avenue, Chicago, Ill., Star Power Pumps, double and single types, as illustrated in our June, 1907, issue, page 216; the H. P. Spark Plug to be described; the Century Lamps, described in our June, 1907, issue, page 216; Goggles, and also a complete line of Automobile Accessories.

ATWOOD MFG. CO., Amesbury, Mass., full line of 1908 Gas Headlights, Oil Side Lights, Tail Lights, Electric Lamps and Generators, newest designs of which will be illustrated and described in the January Journal.

AUTO GOODS CO., 95 Milk street, Boston, Mass., the Cinch Tire Repair Kit, as described in our March, 1906, issue, page 306, and April, 1907, issue, page 192.

AVERY PORTABLE LIGHTING CO., Milwaukee, Wis., "Autogas" tanks, described in our September, 1906, number, page 164, with a new method of fastening to the running board, to be illustrated in our next issue; also the "Autogas" tire filling tank, described on page 240 of the January, 1907, Journal.

BEMUS, T. ALTON CO., Boston, Mass., "Bemus" latest Timers and Distributors, as described in our February, 1907, number, page 354, and in this issue, page 264.

CARTIER, CHAPMAN & CO., Ludington, Mich., Models E and F wind shields, to be described in our next issue. These are half-folding, while the Models A and B, which have been described in these columns, are full folding.

CHICAGO BATTERY CO., 1400 Michigan avenue, Chicago, Ill., "Duro" ignition battery, described in the December, 1906, number, page 192, and the "Duro" electric searchlight, described in the same number, page 202; also full line of dome lights, battery charging plugs, and other electrical specialties.

CHICAGO WIND SHIELD CO., 235 Johnson street, Chicago, Ill., line of wind shields, to be described.

DUPLEX COIL CO., Fon-du-Lac, Wis., "Du-

Hosted by Google

plex" spark coils, described January, 1905, page 248.

FOWLER-MANSON-SHERMON CYCLE MFG. CO., S. W. Corner Rush and North Water streets, Chicago, Ill., 1908 Manson Motorcycle, to be described in a future issue. This is a Thor type machine, listing at $225.

FRANCO-AMERICAN AUTO SUPPLY CO., 1404 Michigan avenue, Chicago, Ill., line of automobile supplies.

EDMUND E. HANS CO., 424 South Fourth street, Minneapolis, Minn., "Hans" gasoline indicator, described in this number, page 228.

HARLEY-DAVIDSON MOTOR CO., 35 East Adams street, Chicago, Ill., 1908 Harley-Davidson motorcycles, to be described.

IMPERIAL BRASS MFG. CO., 241-249 South Jefferson street, Chicago, Ill., large variety of brass fittings, including tire pump, described February, 1906, page 180; gasooline strainer, robe and apparel holder, new priming cups and gasoline cocks, to be described, and air pumps, pressure regulators, gasoline systems, lamp brackets, name plates, hood and radiator fittings, wind shield fittings, etc.

LIPMAN MFG. CO., Beloit, Wis., "Lipman" circulation pumps, timers and speed indicators, described in our February, 1907, number, page 294, and the "Lipman" dashboard Odometer, described in our May, 1907, number, page 148.

LONGDIN-BRUGGER CO., Fond du Lac, Wis., three motor car tops, one in black pantasote, with black silk lining; one pantasote strap unlined top, and one pantasote black silk lined runabout top; also a full line of their top materials.

LONG MFG. CO., 1432 Michigan avenue, Chicago, Ill., "Long" radiators, which have been described in previous issues of the Journal. Any new features will be described in our next issue.

McCANNA MFG. CO., 56 North Jefferson street, Chicago, Ill., latest McCanna oilers, as described in our November, 1907, issue, page 262. Exhibit will represent a tower decorated with 1- to 12-feed oilers, each oiler being provided with a 6-volt electric light, which is part of the regular equipment.

McCORD & CO., 1412 Old Colony Building, Chicago, Ill., "McCord" force feed oilers, described in our February, 1907, issue, page 372; radiators, carburetors, wire belting, spark plugs, circulating pump and "McKim" copper asbestos gaskets. New features will be described in a future issue.

McMULLEN, ROGER B., 1241 Michigan avenue, Chicago, Ill., prest steel frames and automobile stampings, made by Hydraulic Pressed Steel Co., Cleveland, Ohio.

MUNCIE AUTO PARTS CO., Muncie, Ind., "Muncie" change speed gear, steering apparatus, differentials, etc., made on contract.

NATIONAL OIL PUMP & TANK CO., Dayton, O., "National" gasoline storage outfits, late models of which were described in our March, 1907, number, page 288; 1908 improvements will be described in our next issue.

NEELY, EDWARD & CO., 244-246 Wells street, Chicago, Ill., "Neely" mechanical oilers, to be described in our January number.

NEVER-MISS SPARK PLUG CO., Lansing, Mich., the Never-Miss Ammeters and Voltmeters, as described in our September, 1907, issue, page 160; the Never-Miss Spark Plug, described in our November, 1905, issue, page 164, and the chain repair device, to be described.

PFANSTIEHL ELECTRICAL LABORATORY, North Chicago, Ill., Pfanstiehl Automobile Coils, as described in our August, 1907, issue, page 148; Motorcycle Coils, described in our November, 1907, issue, page 296; and Marine Coils, described in our December issue, page 319.

PITTSFIELD SPARK COIL CO., Dalton, Mass., "Pittsfield" 1908 coils, magnetos, switches, plugs and commutators, new features of which will be described in our next issue.

PRECISION APPLIANCE CO., 832-840 Austin avenue, Chicago, Ill., latest type of Hill Precision Oiler, to be described in our next issue.

WM. C. ROBINSON & SON CO., 336 North street, Baltimore, Md., line of lubricants, including their Autoline, Greoil, Journal Compound, as described in our January, 1906, issue, page 348, and Graphite Machine Grease, a new lubricant, to be described.

ROSS GEAR & TOOL CO., latest Ross Steering Gears, as described in our November, 1907, issue, page 236, and the Ross Bevel Gear Drive, in December, 1906, issue, page 286.

STANDARD LAMP & MFG. CO., 455 South Canal street, Chicago, Ill., full line of acetylene, oil and electric lamps, including the new designs described on page 268, this issue.

STANDARD VARNISH WORKS, 2629 Armour avenue, Chicago, Ill., samples of Standard varnishes, exhibition consisting mainly of bottles containing varnishes for automobile finishing, and a fine selection of varnish gums.

TRIPLE ACTION SPRING CO., 1254 Michigan avenue, Chicago, Ill., "Triple Action" semi-elliptic springs, as described in our September, 1907, issue, page 160, and the platform spring, described in this issue, page 214; also a new full elliptic spring, to be described in our next issue.

UNCAS SPECIALTY CO., Norwich, Conn., "Leavitt" Timer, described February, 1907, page 352; "Leavitt" siren, described March, 1907, page 284, and the latest "Leavitt" distributor, to be described.

VEHICLE TOP AND SUPPLY CO., 900-902 Cass avenue, St. Louis, Mo., one Vesco Top, demonstrating their 1908 construction, which will be described in a future issue. Other new Vesco products have been described in our March, 1907, issue, page 302.

VIVAX STORAGE BATTERY CO., 2224 Michigan avenue, Chicago, Ill., showed the Vivax Sparking Battery, which was described in our September, 1907, issue, page 148.

WARNER CLUTCH CO., 1461 Michigan avenue, Chicago, Ill., "Warner" clutch; 1907 model was described in our March, 1907, number, page 322, and 1908 changes will be described in a future issue.

WESTERN MALLEABLE STEEL CO., 1250 River street, Detroit, Mich., line of steel castings for automobile construction, grey iron cylinders of different design, a flywheel cast with 14 fan blades set at an angle of 45 degrees; also line of drop forgings, including nickel and nickel chrome crank shafts, and one-piece front axles of difficult designs.

WHITELEY STEEL CO., Muncie, Ind., samples of Whiteley Crown Steel Castings.

WRAY PUMP & REGISTER CO., Rochester, N. Y., "Kellogg" and Kellogg, Jr., tire pumps, "National" tire pressure register and "Wraylog" pneumatic jack, all of which are well known to the trade, and have been fully described in previous issues of the Journal.

Directory of Chicago Show Exhibitors

(Alphabetically Arranged)

The few deviations from the Show Catalogue are due to changes made since this list went to press. Wherever the building is not mentioned in the accompanying list the space is in the Coliseum.

Acetyvone Co., 1st Regiment Armory, Gallery 10.
Acme Mot. Car Co., 1st Regiment Armory, E-4.
Aerocar Co. (The) First Regiment Armory, B-3.
Ajax-Grieb Rubber Co., Gallery 58.
American Aluminum Coating Co., Basement 9.
Amer. Elec. Nov. & Mfg. Co., 2nd floor annex 136.
Amer. Locomotive Auto Co., 1st Reg. Armory A-4.
Amer. Motor Car Co., 1st Reg. Armory D-4.
Amer. Mot. Truck Co., 7th Reg. Armory, Main Floor 3.
Apperson Bros. Auto Co., Main Floor C-1.
Armac Motor Co., Second Floor Annex 125.
Arnstein, Eugene, 1st Reg. Armory, Gallery 5-8.
Atlas Mfg. Co., Seventh Regiment Armory.
Atlas Motor Car Co., Basement 34-35.
Atwater-Kent Mfg. Works, 2nd floor Annex 89.
Atwood Mfg. Co., Second Floor Annex 110.
Auburn Automobile Co., 1st Reg. Armory F-1.
Aurora Automatic Mach. Co., Gallery 16-1.
Aurora Motor Works, Basement 23-25.
Austin Automobile Co., 1st Reg. Armory D-1.
Auto Accessories Mfg. Co., 2nd floor Annex 81-82.
Autocar Co., (The), Annex M-1.
Auto Goods Co., Basement 7.
Auto Improvement Co., Gallery 14.
Automobile Topics, Basement 44.
Auto. Utilities Co., 7th Reg. Armory, Gallery E.

Hosted by Google

Auto Parts Co., 1st Reg. Armory, Gallery 32.
Auto Pump Co. (The), Second Floor Annex 98.
Avery Port. Light'g Co., 2nd Floor Annex 116.
Babcock Elec. Carriage Co., Main Floor J-1.
Badger Brass Mfg. Co., Gallery 40-41.
Baker Motor Vehicle Co., Annex O-1.
Baldwin Chain & Mfg. Co., Gallery 61.
The Bartholomew Co., Main Floor D-5.
Bemus, T. Alton, Basement 8.
Bosch, Robt., N. Y., Inc. 1st Reg. Armory, Gal. 39.
Bowser, S. F. & Co., Inc., Gallery 72-73.
Breeze Carburetor Co., 2nd Floor Annex 97.
Briscoe Mfg. Co., 2nd Floor Annex 105.
Brown-Lipe Gear Co., Gallery 36.
Brownell, F. A. Mot. Co., 1st Reg. Armory. Gal. 35
Brush Runabout Co., 7th Reg. Arm. Main floor 8.
Buckeye Mfg. Co., 7th Reg. Armory. Main floor 20.
Buckeye Mfg. Co., First Regiment Armory A-1.
Bugmobile Co. of America, Basement 4.
Byrne, Kingston & Co., Gallery 75.
C V. I. Motor Car Co., Basement 41-43.
Cadillac Motor Car Co., Annex O-2 and 3.
Cartier, Chapman & Co., 7th Reg. Arm. Gal F.
Central Rub. Co., 1st Reg. Armory, Gallery 38.
Chase, L. C. & Co., Second Floor Annex 1344.
Chicago Battery Co., Gallery 22.
Chicago Coach & Carriage Co. First Reg. Armory, E-1 West 1-2.
Chicago School of Motoring, Basement 5.
Chicago Wind Shield Co., Basement 52.
Class Journal Co. (The), 1st Reg. Arm. Gal. 29.
Cleveland Motor Car Co., 1st Reg. Armory C-1.
Columbus Buggy Co., First Reg. Armory A-2.
Colt Runabout Co., 7th Reg. Arm. Main Floor 26.
Commercial Motor Truck Co., 7th Reg. Armory, Main Floor 15.
Conn. Tel. & Elec. Co., 2nd Floor Annex 114.
Cooks, Adam Sons, Gallery 6.
Cook's Standard Tool Co., Gallery 70.
Coppock Mot. Car Co., 7th Reg. Arm. Main floor 17.
Corbin Mot. Veh. Corporation Annex Q-4 and 5.
Cornish-Friedberg Motor Car Co., Basement 36-40.
Consolidated Mfg. Co., Second Floor Annex 130-131
Continental Caoutchouc Co., 1st Reg. Arm. Gal. 3-4
Continental Motor Car Co., 7th Regiment Armory, Main Floor 27.
Couple-Gear Freight-Wheel Co., 7th Reg. Armory, Main Floor 10.
Cowles, C. & Co., Second Floor Annex 96.
Wm. Cramp & Sons. S. & E. Bldg., Gallery 20.
Curtis, C. H. Mfg. Co., 2nd Floor Annex 126.
Cycle & Automobile Trade Journal. 1st Regiment Armory, Gallery 17.
Dayton Electrical Mfg. Co., Gallery 29.
Dayton Motor Car Co., Main Floor D-1.
De Luxe Motor Car Co., 1st Reg. Armory D-2.
Diamond Chain & Mfg. Co., Gallery 55.
Diamond Rubber Co., Gallery 34-35.
Diamond Rub. Co., 7th Reg. Armory. Gal. 34-35.
Diamond T. Motor Car Co., 1st Reg. Armory, Main Floor F-2.
Dietz, R. E. Co., Gallery 28.
Diezemann Shock Absorber Co., 2d floor annex 115
Dixon Crucible Co., Jos., Second Floor Annex 87.
Dolson Automobile, First Regiment Armory E-3.
Dragon Automobile Co., Annex N-1.
Duff Mfg. Co. (The), Second Floor Annex 83.
Duplex Coil Co., (The), Basement 48.
Edmunds & Jones Mfg. Co. (The), Gallery 74.
Elec. & Mechanical Development Co., 1st Reg. Armory, Gallery 36.
Electric Storage Battery Co., Gallery 12.
Electric Vehicle Co., Main Floor A-4.
Elmore Mfg. Co., Main Floor C-3.
Empire Auto Tire Co., 2nd Floor Annex 92.
Excelsior Mot. & Mfg. Co., 2nd Floor Annex 129.
Excelsior Supply Co., 1st Reg. Armory. Gal. 25-28.
Firestone Tire & Rubber Co., Gallery 67-68.
Firestone Tire & Rub. Co., 7th Regiment Armory, Gallery 67-68.
Fisk Rubber Co., Gallery 53-54.
Fowler-Manson-Sherman Cycle Mfg. Co., Second Floor Annex 127.
Franklin, H. H. Mfg. Co., 7th Regiment Armory, Main Floor 4.
H. H. Franklin Mfg. Co., Main Floor D-4.
Franco-American Auto. & Supply Co., 1st Regiment Armory, Gallery 15-16.
G & J Tire Co., Gallery 38-39.
Gabriel Horn Mfg. Co., 2nd Floor Annex 142.
Gaeth Automobile Works, Basement 31-32.
Gearless Transmis. Co., 1st Reg. Armory B-4.
Gemmer Mfg. Co., Second Floor Annex 104.
General Vehicle Co., 7th Reg. Arm. Main Floor 21.
Gifford-Pettit Mfg. Co., 7th Regiment Armory, Main Floor 19.
Goodrich, B. F. Co., Gallery 47-48.
Goodyear Tire & Rubber Co., Gallery 59-60.
Goodyear Tire & Rubber Co., 7th Reg. Armory, Gallery D.
Gray & Davis, Gallery 43.
Gray-Hawley Mfg. Co., 2nd Floor Annex 99.
Ham, C. T. Mfg. Co., 2nd Floor Annex 143.
Hancock Mfg. Co., Gallery 78.
Hardy, R. E. Co., Second Floor Annex 86.
Harley-Davidson Mot. Co., 2nd Floor Annex 124.
Harris, A. W. Oil Co., Gallery 44.
Hartford Auto Parts Co., 7th Reg. Arm. Gal. C.
Hatfield Motor Vehicle Co., Basement 33.
Hartford Rub. Wks., 7th Reg. Arm. Gallery 30-31.
Hartford Rub. Works Co., Gallery 30-31.
Hartford Suspension Co., Gallery 19.
Haus, Edmund E. Co., 1st Reg. Arm. Gal. 33-34.
Haynes Automobile Co., Main Floor F-4.
Healey Leather Tire Co., 1st Reg. Arm. Gal. 31.
Heinze Electric Co., Second Floor Annex 106.
Heitger Carburetor Co., 1st Reg. Arm. Gallery 30.
Hendee Mfg. Co., Second Floor Annex 122-123.
Hoffecker Co., (The), Second Floor Annex 95.
Holsman Automobile, First Reg. Armory G-1.
Hornecker Mot. Mfg. Co., 2nd Floor Annex 141.
Horseless Age, 1st Reg. Armory, Gallery 22.
Hotchkin Mfg. Co., Second Floor Annex 80.
Hyatt Roller Bearing Co., Galery 50.
Igniter Appliance Co., 2nd Floor Annex 138.

K. W. Ignition Co., Basement 1.
Kinsey Mfg. Co., Gallery 1.
Kissel Mot. Car Co., 1st Reg. Armory G-5.
Knight & Kilbourne, 1st Regiment Armory A-3.
Knox Auto. Co., 7th Reg. Armory. Main floor 25.
Knox Automobile Co., Main Floor A-5.
Kokomo Electric Co., Gallery 76.
Lauth-Juergens Motor Car Co., Basement 11-13.
Lear, Oscar, Auto Co., 7th Reg. Armory. Main Floor 5.
Oscar Lear Automobile Co., 1st Reg. Arm. E-2.
Leather Tire Goods Co., Gallery 79.
Light Mfg. & Foundry Co., 2nd Floor Annex 128.
Limousine Carriage Mfg. Co., 2nd floor Annex 146.
Lipman Mfg. Co., (The), Second Floor Annex 100.
Locomobile Co. of America. Main Floor A-2.
Logan Construction Co., 7th Regiment Armory, Main Floor 23.
Longdin-Brugger Co., Basement 49-50.
Long Mfg. Co., Gallery 52.
Lorraine Automobile Mfg. Co., Basement 27-28.
The Lozier Motor Co., Main Floor C-5.
M. A. A. M. Inc. Office, Gallery 69.
McCanna Mfg. Co., 1st Reg. Armory, Gallery 18.
McCord & Co., Gallery 13.
McMullen, Roger B., Basement 21-22.
Manhattan Screw & Stamping Co., 1st Regiment Armory, Gallery 23-24.
Matheson Motor Car Co., Main Floor E-3.
Maxwell-Briscoe Motor Co., Main Floor E-4.
Meiselbach, M. A. D. Motor Wagon Co., 7th Regiment Armory, Main Floor 12.
Merkel Motor Co., Second Floor Annex 132-133.
Michelin Tire Co., Second Floor Annex 102-103.
Midgley Mfg. Co. (The) Second Floor Annex 85.
Mitchell Mot. Car Co., 7th Reg. Arm. Main floor 13.
Mitchell Motor Car Co., Main Floor K-1.
Moline Auto. Co., 1st Reg. Armory E-6.
Monarch Mot. Car Co., 1st Regiment Armory E-5.
Moon Motor Car Co., 1st Regiment Armory C-2.
Morgan & Wright, Gallery 26-27.
Morgan & Wright, 7th Reg. Arm. Gallery 26-27.
Morrison, McIntosh & Co., 1st Reg. Arm. Gal. 21.
Mosler, A. R. & Co., Second Floor Annex 147.
Motor, First Reg. Armory, Gallery 9.
Mot. & Accessories Mfgrs., Inc., Gallery 69.
Motor Age, 1st Reg. Armory. Galery 24-A.
Mot. Car Specialty Co., 2nd Floor Annex 112.
Motor Way (The), 1st Reg. Armory, Gallery 2.

Legal and Legislative

ALABAMA.

The Blackmon automobile bill, which passed both Houses, but was not approved by the Governor.

CALIFORNIA.

Sacramento.—Authorities are enforcing the law which requires the horn to be sounded as an automobile passes street crossings.

Los Angeles Council has past the following schedule governing the hire of public automobiles: "Autos for five passengers, $5 an hour for less than ten hours and $3.50 an hour for more than ten hours; seven passengers, $4 an hour for less than ten hours, and $2 an hour for more than ten hours; two passengers, $3 an hour for less than ten hours and $2 an hour for more than ten hours."

DISTRICT OF COLUMBIA.

Washington.—Among the regulations now under consideration is one forbidding sight-seeing vehicles to stand longer than fifteen minutes at a time at any place other than a public hack stand, nor at such place again until the expiration of an hour. Another rule is that no proprietor of a sight-seeing automobile shall have more than two offices within the city, and that only one car at a time shall be permitted to stand in front of each office.

PENNSYLVANIA.

Philadelphia.—Announcement was sent out by the Director of Public Safety that the city ordinance requiring automobilists to secure local licenses would be enforced. Visiting autoists from other cities are given forty-eight hours grace while in Philadelphia.

SPECIAL NOTICE

We are now revising and correcting the 8th Annual "Buyers' Guide," which will appear in the January number of the CYCLE & AUTOMOBILE TRADE JOURNAL. If you have not returned the "pink sheet" sent you duly corrected, do so promptly. If you have not received one of these pink sheets and are manufacturing anything for the trade, advise us promptly, giving full particulars of your product.

CYCLE & AUTOMOBILE TRADE JOURNAL

Market & 49th Sts., Phila.

Date of Ormond Beach Carnival Chosen

At the meeting in New York City, on October 29, of representatives of the Florida East Coast Automobile Association, definite action was taken regarding the sixth annual winter Florida tournament. Following the belief of many that the former dates were too early the last week in March has been selected.

Many radical changes will be made in the program of races at the coming meet.

Reduction in Rubber

Owing to the reduction in the price of crude rubber the Swinehart Clincher Tire & Rubber Company, of Akron, O., announces a reduction in the price of its tires to take immediate effect. Crude rubber to-day sells at 35 cents per pound less than it did a year ago. This is the lowest price at which rubber has been sold since November and December, 1903.

September Exports

The automobile export statistics for the month of September show a perceptible falling off, while for the nine months ending September there is an impressive increase.

Brush at the Show

Chicago, November 30 - December 7

Every dealer owes it to himself to see the Brush Runabout line. The little "one lunger" has uncovered a demand and a market so enormous that previous figures on automobile consumption must be revised. Those who thought that a successful low priced car must be a cheapened imitation of the high priced one have missed their guess so far as we are concerned. While the demand for sport automobiles is still great, the demand for the utility car is many times greater. The bare announcement of the Brush Runabout has brought out a tidal wave of inquiries and orders. Some people of course don't want it, but others do, and in such numbers that we have been swamped. This type of car seems to have uncovered the biggest market yet. As we are now absolutely without competition, we have it all to ourselves. For the balance of this year, we can take on new trade only to the extent of samples, but our increased equipment is almost completed and for 1908 we expect to cover all important points in this country.

MICHELIN

FRANCE ENGLAND
ITALY AMERICA

MANUFACTURERS can now AFFORD TO EQUIP THEIR CARS WITH MICHELIN TIRES AND THEY CANNOT AFFORD NOT TO DO SO.

The high import duty and heavy transportation charges have been eliminated through the erection of our American Michelin factory.

The tires made here are exactly identical with the outputs of our other factories in France, England and Italy—the same famous Michelins that have been used on winning cars in all the world's greatest races for the last six years, and which made th victories possible.

Michelin Tires are the standard of the world. They will be used on a large number of America's highest-priced 1908 cars, and they will be the standard equipment of leading cars in other classes. These manufacturers, by the use of Michelins, are stamping their cars as embodying in EVERY FEATURE THE BEST that money can buy.

By equipping with Michelins the manufacturer gives his agents a se ing proposition of tremendous power; he gives the purchaser confide that his cars are, in every particular, the best that can be bought for t price—the purchaser DESERVES to be given the best tires the manuf turer can afford—and he CAN afford Michelins.

WHAT MANUFACTURER CAN AFFORD TO IGNORE THE INTERESTS OF HIS AGENTS —THE INTEREST OF HIS CUSTOMERS?

tice. The weight is light, with ample power, and these cars can easily make 60 miles on a good road.

THE CLUTCH AND BRAKES.

The Second Imperial clutch is 5 disks, three of gray-iron and two of bronze with cork inserts; these coacting friction surfaces are pinched together by toggle-actuated bell-cranks, having temper-screws fitted to their free ends, to permit exact pressure equalization.

The brakes are exterior and interior, on and in prest steel rear hub drums, 12 inches diameter. The exterior bands are camel's hair faced. The interior, steel-casting, jointed brake-shoes, bronze-faced, are toggle expanded, metal to metal contact. No line-shaft brake is fitted.

SPRINGS.

The springs are special material, very carefully treated, and are all half-elliptics, lipped and banded. The spring specifications are, front, 38x2 inches, 8 leaves, jointed to the chassis frame in front and linked in the rear.

The rear springs are 48x2 inches, 7 leaves, linked both front and rear to the chassis frame, thus permitting a perfectly free spring action in connection with the struts and torsion arm.

The steering is the Gemmer right and left screw threads action, locked and capable of adjustments for taking up lost motion. The spark and throttle levers, ratchet retained, are on top of the hand wheel. No throttle pedal is used.

There are two pedals on the foot-board. That at the left releases the clutch only. The right pedal, when pushed forward, applies the rear hub internal brake-shoes only.

There are two levers at the driver's right. The outside lever is pulled backward to first release the clutch and then apply the rear-hub, exterior, emergency brake-bands. The inside hand-lever works the selective change gear.

Economy Test of Atwater-Kent Spark Generator

In order to demonstrate to the public the enormous mileage possible from the ordinary dry cells when used in connection with the Atwater-Kent Spark Generator, its manufacturer, the Atwater-Kent Manufacturing Co., of Philadelphia, arranged an official sealed test. A glass case was provided in which was placed an Atwater-Kent Spark Generator connected to four spark plugs, and driven by an electric motor so geared that the number of sparks would correspond to those of an automobile four-cylinder engine, the machine being geared three to one with 34-inch wheels, and averaging about 23 to 25 miles per hour. The spark gap was made approximately 7-64ths of an inch, being large in order to be the equivalent of a shorter spark gap working under compression. With this gear ratio and a Jones Speedometer-Odometer, it was possible to make a record of the exact equivalent running in miles. The entire apparatus was personally sealed by Albert W. Jacobi, representing the Automobile Club of America. The Speedometer-Odometer was approved by Joseph W. Jones, and the sealing was witnessed by members of the technical staffs of several of the automobile papers. The test was started at the Grand Central Palace Show, and run during the day and shut off during the night. The Speedometer at the time of starting indicated twenty-three miles an hour and the mechanism ran for upward of two weeks. At the close of the Palace Show the Odometer registered over 1,700 miles, and at the end of the test, which was finished at the Madison Square Garden Show, the Odometer reading was 4,249.3 miles. Six-inch Columbia dry cells were used, and showed at the beginning an average of 16 amperes, and at the close tested 6.5 amperes.

Seven Perfect Scores Made in New Jersey's 24-Hour Run

Fourteen of the twenty-two starters in the New Jersey Automobile and Motor Club's twenty-four-hour run, November 15 and 16, survived the contest, seven of these holding perfect scores.

The contest covered a distance of 472 miles over roads varying in condition from fine macadam to a mere path across a swamp.

The drivers were required to keep going continuously for 24 hours over a five-lap circuit from the club house in Newark thru Bloomfield, Glen Ridge, Montclair, Verona, Caldwell, Pine Brook, Parsippany, Danville, Dover, Kenvil, Mount Freedom, Morristown, Bernardsville, Far Hills, Bedminster, Somerville, Bound Brook, Plainfield, Springfield, Irvington, and back to the club house.

Penalization was imposed as follows: Two points for every minute over three minutes that a car is allowed to be ahead or behind the schedule at controls, 3 points per minute for stoppage of motor between controls without making an adjustment or repair, 3 points per minute for stopping car on last circuit without making repairs or adjustments, 4 points per minute for motor stop for repairs, 2 points per minute for repair or replacement with motor running, and 2 points for driving car in circle to delay passing final control. Double penalties were imposed for accepting assistance in making repairs.

The following are the seven perfect score survivors, and will be presented with silver loving cups:

Car.	Driver.	
Matheson,	John B. Ryall.	Touring car.
Haynes,	R. G. Kelsey, J. Calhoun.	Runabout.
Oldsmobile,	Ralph Owen.	Touring car.
Locomobile,	R. A. Greene.	Touring car.
Ford Six,	A. T. Purcell.	Runabout.

An Ignition Department Suggested

We would direct the attention of our readers to the following communication, and in reference to same would say that if our readers want us to inaugurate a department of this character we will make every effort to meet with their views. We therefore hope to hear from all those interested in this subject.

November 5th, 1907.

Cycle and Automobile Trade Journal, 49th and Market streets, Philadelphia, Pa.

Dear Sirs:—We take the liberty of writing to you to ask consideration of a subject which seems to us one of great importance to the automobile industry, in fact to all gasoline engine industries. It is that you will have a Department of Ignition in your magazine. This ignition question is the one which is causing the most trouble and dissatisfaction of all the problems of automobiling. And we believe that it is entirely possible of early solution by very simple methods. That is that it needs only to be "understood," really understood, to be solved. This understanding can only follow a study of results of tests, experiments, records, etc., made for the express purpose.

There is no science in existence which covers the ignition question. There are no text books which are reliable guides. Ohms law, which is looked upon as the Alpha and Omega of electricity, does not apply to ignition conditions. It cannot be reconciled to the workings of batteries and coils. The science of ignition is not formulated, but it should be without delay, and you may accomplish an immense amount of service to the industries concerned by undertaking the task, and its importance is not second to anything.

We do not mean that you open a department for publishing letters from Tom that he finds dry batteries perfect; from Dick that he finds dry batteries absolutely the cause of all his troubles; from Harry that he had wonderful results from some unheard of combination of coils, batteries, timers and wiring. That would lead to nothing, for the conditions of use which brought the results reported by correspondents would be unknown, consequently the results not possible of interpretation. And when we refer to dry batteries merely, do not understand that we mean the department to be confined only to that detail. All details of ignition should be studied both individually and in connection with each other.

We would suggest that you organize such a department with some man in charge who has the mental equipment for investigation, experimentation and weighing of results. And by all means not one who has a firmly established opinion to be "unlearned" or even one of scientific education, for he would be unfitted by such education to undertake the discovery of a new science. He would be prejudiced with the view that science is supreme and sacred and must not be attacked. That is a good and proper clew "when science has been formed." But all sciences are based on experiments and experience. They are not created full grown.

His duties would be the collection of "facts," then experimentation under his own direction, and the tabulation and study of results obtained from definite conditions. He should have a laboratory with proper equipment, altho such equipment would be quite simple and not of large expense to start with, and we believe that the manufacturers of such articles as he would test will be glad to do their share by contributing their goods without charge. We know he will be only too pleased to furnish him with our goods. His department should not be used for the benefit or prejudice of any article, but the results which he obtained from time to time should be published for the benefit of all and regardless of benefit or injury. It may be done without reference to particular articles, we mean only general rules. For instance he could determine and settle the proper size of battery to use with jump sparks coils and the proper size for primary coils. The proper adjustment of vibrators, conditions of wiring, grounding on engine, qualities and arrangements of timers. In fact, a lot of "reliable information" where exists today a conflict of ideas and opinions and "blamings-on-the-other-fellows."

It would be of great value to all concerned; the public, the manufacturers of the details, as well as the makers of the machines, and the experts who are studying to improve conditions wherever they exist.

Yours truly,
THE SEMI-DRY BATTERY COMPANY,
Per Jackson.

Too Good to Pass By

The following letter was received by the editorial department of the Cycle and Automobile Trade Journal from the Rockford Automobile and Engine Co., Rockford, Illinois in answer to a letter for matter for the Dealers' Department:

In answer to your favor of November 1st, will state that for good and varied reasons we do not see fit to favor you with the data requested, and will state a few reasons why. We are not in the business for our health. We are making a success of the automobile business thru knowledge which we have gleaned from the school of experience. We have never copied after methods of others in conducting our business, nor have we imitated others in the style or model of the products which we manufacture.

We are quite original in our way of doing business. We make a success of same by attending strictly to it. There is too much competition in the automobile business to-day to warrant us in making public peculiar features of same which we think lead to success. We are also too busy to take an active part in a correspondence business college. We will, however, favor you with three sugestions which make for the betterment of the conditions for the agent.

1st advertise.

2nd advertise in the Cycle & Automobile Trade Journal.

"Last but not least," read the Cycle & Automobile Trade Journal.

We sincerely hope that some day in the future after we have elevated ourselves above the aggregation of intellectual giants now in the manufacture of automobiles we will be able to look down upon them from the high plane of success, and be glad and willing to reach down and lead them over the road which we are traveling.

The name of this firm you will find above. It is under the management of

Yours very truly,
JOHN F. WATERS, Secretary,
Rockford Automobile & Engine Co.

Hosted by Google

described. The line of cars offered for 08 with general specifications was given our issue of October, page 93, but com- ete details were not obtainable at that me. The price of the touring car and adster, the chasses of which are iden- cal, is $3500.

SPECIAL FEATURES.

The clutch of the multiple disk type is ew, and is housed in the forward end of e change speed gear case. This clutch nsists of 52 effective steel plates of 1-16 ch thickness, made of high carbon duc- le stock; the peculiarity of these plates is at they are stampt into a conoidal shape, e surface being slightly different from e true cone, as it is somewhat curved. his arrangement causes the plates to en- ge very gradually, and when released the ring of the curved portion of the plates parates them regardless of the kind of bricating oil used, the company claiming at the clutch will disengage as readily hen run in heavy oils or even greases when the lighter oils are used. Under nning conditions, the same lubricant, nsisting of one-half heavy oil and one- lf grease, that is used in the change eed gear is used in the clutch.

The rockers for engaging and disengag- g this clutch are provided with steel llers at the ends, the plates being en- ged by a helical center spring, of ap- oximately 300 pounds tension, the ten- on being adjustable. This clutch is self- ntained, and gives absolutely no end rust, except for the period when dis- gaged, at which time the end thrust of e spring is taken on an F & S annular ll bearing of liberal size. The change eed gear is of the four speed and re- erse sliding type, being operated on the lective principle, by a lever working in H slot. The direct drive, however, is the third speed with accelerated tail aft on the fourth. This arrangement ermits of the use of the direct drive actically all the time, and also allows an extremely high speed, with the tail aft running faster than the engine, when esired. Annular ball bearings are used nd the shafts are milled, forming four tegral splines for the sliding gear mem- ers. At the rear of the change speed ear case is a 14-inch wheel with heavy tchet teeth, so arranged that it can be gaged by a plunger pawl, the device king the place of a sprag. The base the pawl is an accurate sliding fit into cylinder, thus forming a sort of dash pot.

end over which fits the rear portion of housing, this rear end being provided w an internal annular recess containing strip of felt. This felt comes in cont with the spherical portion of the forw part of the case, thus making a dust ti but flexible joint. The rear univer joint is so arranged that the driving ef is transmitted by the outer ends of a fitted with bronze shoes, which are f to slide longitudinally in suitably sha semi-circular grooves of considera length in the outside casing, which is to the bevel pinion shaft. The casing of steel, and has a long hub taper ke to the integral bevel pinion shaft, bevel pinion being supported both fr and back by large F & S annular ball be ings.

1908 Cleveland Touring Car. A new multiple clutch, the plates being conoidal in shape is used; four sp and one reverse sliding change speed gear direct on third, a large ratchet wheel sprag is fitted just back of gear case. The touring car and roadster are each $350

A CLEVER ADJUSTING DEVICE.

An adjusting device is provided so the bevel pinion and its shaft can moved slightly in a longitudinal direct bringing the teeth into or out of m with the large bevel gear. This is acc plished in the following manner: The nual bearing in front of the bevel pinio held against a collar on the bevel pi shaft on one side and a nut on this s at the other side, so that if this bearin moved in either direction the bevel ion and shaft must move with it. On exterior of the annular ball race threads into which or upon which an side band or collar is screwed. This

Digitized by Google

vented from rotating, and is retained rigidly in position by means of a tight fitting yoke, which presses upon it when bolted in position. This collar also bears on the outside annular ball race, thus clamping the combination rigidly in position, but an adjustment can easily be made by simply loosening the yoke and turning the collar.

THE DIFFERENTIAL AND AXLE CONSTRUCTION.

A differential of large sized bevel gears of five pitch is used, well supported in annular ball bearings. The rear axle is of the floating type, driving the wheels by means of lug clutches at the ends. This axle is also well braced by a liberal sized truss rod, ⅝-inch in diameter at the smallest section, and considerably larger where threaded for the turn buckles; in fact, the 1908 Clevelands are noticeable for the liberal sized parts used. An "I" beam torsion rod is provided, and radius rods are also fitted, their rear ends being revolvably mounted upon split bronze bushings, which are clamped around the steel rear axle housing, thus bringing all the wear on the bushings and not on the housing. These bushings also serve for the swivel mounting of the rear spring seats. The front axle is an I beam drop forging, without weld. The steering knuckle pivot is mounted on ball bearings and the cross link or tie rod is in a protected position at the rear of the front axle. The steering gear is of the screw and nut type.

BRAKES.

The brakes are both internal expanding in separate drums on the rear wheels, the external brake being 16 inches in diameter by 3 inch face. These brakes are both metal to metal, the drums being prest steel, while the bands are manganese bronze, cam operated in the usual way. A single-tree type of equalizer is used on the foot brake, which is the outside band; the other brake is operated by the usual side lever. The muffler is constructed entirely of prest steel, and is provided with a cut-out operated by a short foot pedal. All points where there is any motion whatever are provided with grease cups and the brake rods and spring eyes are fitted with spring oilers. The muffler rod, sprag operating rod, brake rods, etc., are arranged so that they have a direct pull, and are not put in on the bias.

THE MOTOR.

The motor is of the standard four-cylinder vertical type, water cooled cylinders cast in pairs, valves on one side, and two independent systems of ignition are used. Both systems are of the jump spark type, one consisting of a high tension magneto, and the other being a distributor and single vibrating coil, current being supplied by storage battery. A double set of plugs is used, these being placed over the valves. An aluminum-bladed bronze hub, ball bearing fan, is mounted close to the rear of the radiator, the hub forming a cap so that no dust can get into the ball bearings. The fan is driven by a flat belt from an aluminum pulley at the forward end of a horizontal gear driven shaft, the rear end of which drives the centrifugal pump and magneto. The dash is mahogany with brass edges, while the floor boards are aluminum, being supported by an aluminum casting which rests on the steel frame and rigidly braces the dash, and also forms a solid support for the steering column.

The spark and throttle levers operate on an aluminum sector on the steering wheel, each lever being provided with a small hard rubber thumb button which releases it when the lever is grasped, but which locks it in position when the hand is removed. The steering wheel is of large diameter, the arms being of aluminum channel section, and having a continuous integral rim. The rear ends of the chassis side frame members are bent upward into an arch so that in case of going over an excessive bump, there will be no chance for the frame hitting the axle and no necessity for bumpers.

The gasoline tank is of 22 gallons capacity, made of copper and placed under the front seat, pressure feed being used, altho this is only necessary when the tank is almost empty. A large strainer is interposed in the gasoline line between the tank and Schebler carburetor. The tank filling hole is about 6 inches in diameter, and the cover is held by a removable yoke, making it not only easy to fill the tank, but possible to clean it out thoroly.

Delaware County Good Roads Convention

About two hundred and fifty autoists and enthusiasts gathered at Strath Haven Inn, Swarthmore, Pa., on Saturday, October 26, as guests of the Good Roads Association of Delaware County, to discuss the various phases of improved highways.

The meeting was a very enthusiastic one, and was called to order by President J. W. Weeks, of the Delaware County Automobile Club, who occupied the chair. State Senator Sproul, after whom the present good roads law of Pennsylvania is named, urged the people, the township and boroughs to take hold of the problem at once, and not wait for help from the State, altho he admitted that Pennsylvania would eventually be forced to follow the example of New York in the building and maintenance of main highways.

The recent annual election of the Automobile Club of Maryland resulted as follows: President, James Stone; vice-president, Dr. H. F. Rowe; secretary, E. A. Dolle; treasurer, Ernest J. Knabe.

"THE SCIENTIFIC CARBURETOR" and a prominent one of the float feed variety

What is the result of such comparison?

Distinct advantages which prove the superiority of

"THE SCIENTIFIC CARBURETOR"

(DETAILS ON OPPOSITE PAGE)

Hosted by Google

Suppose very fine particles of dirt or foreign matter get lodged on the seat of the gasoline valve Y (Fig. 2). It floods, doesn't it? This is liable to happen at any time, isn't it?
Notice the strainer gauze C in **"THE SCIENTIFIC CARBURETOR."**

Your Engine when running, is of course, constantly exploding; that means vibration. The wheels of your car are constantly coming in contact with irregularities, however slight, in the road surface; that's vibration. If you think that any light cork float, (F, Fig. 2) which keeps bounding up and down in response to waves in the float chamber B can keep the "level" of the gasoline anywhere near the proper distance of ⅛" below orifice of the spraying nozzle D, place a cup of water on the floor of your car and see how long any one level is kept.

No Vibration of the engine or car can affect the feeding of the fuel in **"THE SCIENTIFIC CARBURETOR"**, for, when the jump valve L (Fig. 1) rises, upon the suction stroke of the engine, the unvarying pressure caused by the head of gasoline in the tank, forces the amount of gasoline allowed to pass the point of the needle valve D directly into the currents of air then rushing past with the result that a given quantity of air measured by the throttle opening, and a certain amount of gasoline, measured by the needle valve are always constant and proportional to each other.

In the float feed carburetor (Fig. 2) in order to mix the gasoline with the air of the charge the following requirements are necessary: The main air opening to the carburetor X is closed by the valve A prest against its seat so strongly by the spring O that a pressure, in some cases equal to six lbs. is required to open it, and, because of this restriction, the engine, upon its suction stroke creates a vacuum in the chamber C, and the liquid in the float chamber B being under atmospheric pressure, rushes thru the spraying nozzle D by which it is transformed into small drops, in which state it is supposed to more easily mix with the air of the charge. Of course the makers of this type of carburetor claim that the valve A will open when the pressure becomes excessive by the speed of the engine being increased, but nevertheless, it is obvious that any restriction in the inlet pipe of the engine, whether it be of the straight Venturi Tube form introduced immediately around the jet as used by one maker, the air inlet valve restriction shown above, or the curved Venturi Tube form of restriction having in the lower side of the bend a puddle of gasoline over which the air of the charge is drawn, as used by another prominent maker in his latest model; nevertheless the passage must be restricted in order to accomplish the breaking up of the gasoline into fine drops, and to accomplish this, altho ridiculous it may seem, it is nevertheless a fact that the users of the most advanced types of float feed carburetors are tolerating a throttling of their engines in many cases to the extent of 50 per cent. by the carburetor.

In "THE SCIENTIFIC CARBURETOR"

(Fig. 1) there are no restrictions to throttle the engine as the wire mesh covered fan wheel N accomplishes the duty of breaking up the gasoline and thoroly blending it with the air in the charge far more perfectly than any spraying nozzle form of vaporizer can ever do, and the charge is forced into the cylinder by contact with the rapidly moving vanes of the fan wheel N, rather than introducing any obstruction to their flow. ¶ *By the use of the turbine wheel R, alone, in further reducing the amount of exhaust gases left in the cylinder from the previous explosion, we are able to increase the power of an engine 15 per cent.*

These are only four *of the 28 reasons why the users of* **"THE SCIENTIFIC CARBURETOR"** *are able to secure 25 per cent. to 50 per cent. more speed, flexibility to a degree that will enable them to run their car at a slow walk on the high gear, have a 30 per cent. cooler engine, save from 30 per cent. to 50 per cent. of the fuel generally used, have no more smoke, smell, sooted spark plugs, miss-fires or ever experience a lack of ability to "pick up" instantly at any speed.*

Fig. 5. Hol-Tan four-cylinder motor, in pla ce in chassis. Left hand side, showing dual-u cylinders, with vertical valves in the cylinder heads, overhead cam-shaft, vertical shaft cam-shaft and water-pump drive. Eight-lead, force-feed, single-plunger pump lubrication sy tem at the right hand. Design by Louis P. Mooers.

AXLES.

The front axle is an I-beam section, steel op forging. The front wheels and float- g rear axles are on 2-point, adjustable ll bearings. The stub-axle steering arms tend to the rear. The rear axle is a steel casting gear housing, divided so to permit removing the entire gear sembly. Spur balance gear is fitted. T steel tube axle sleeves are in rigid ass bly with a steel tube triangle which tern ates in a globe forward, and serves

Digitized by Google

rings surrounding the outward ends of axle sleeve-tubes. The floating axle fts are on adjustable 2-point ball rings.

STRUTS AND TORSION ARM.

Neither struts nor torsion are fitted, the be-end triangular rear axle structure re-ing torsion and transmiting the driving ct to the chassis frame. This avoids necessity for strut adjustment, and avoids the inevitable discrepancy be-en spring movement and strut move-nt.

THE SPRINGS.

The front springs are half-elliptics, nted in front and linked in the rear. e rear springs are full elliptics, scroll-d, revolubly mounted both on the rear e and at the chassis frame brackets on . The springs are all tongued and oved and banded.

THE BRAKES.

These are exterior and interior on and the steel castings rear hub brake-drums, ich are of ample diameter. The exterior ke band is Gandy belting faced and 3-e lever applied. The inside shoes, also ndy, belting faced, are jointed, and are gle-expanded. The brake pull equalizers Mooers 1908 design, full length steel es, reaching all the way across between brake links, and having a universally whole brake action is perfectly equaliz perfectly free to follow the rear whe lift and drop at either end, and is powerf well designed and thoroly built.

THE CLUTCH.

The clutch is of the multiple disk ty with a sufficient number of flat disks, corrugations, to give a gradual engageme with a strong slipping drive and to tra mit the maximum motor power with co paratively light spring pressure. Th clutch it is claimed gives complete sat faction, requires no attention and is ve easily operated.

The steering action is the Gemmer, rig and left screw threads, self-locking, pow ful and capable of adjustment to elimina lost motion.

CONTROL.

The spark and throttle levers are ratch retained on top of the hand wheel, and accelerator pedal is fitted which opens t throttle independently of the hand lev adjustment. There are two large pedals the foot board. The left pedal releases t clutch only. The right pedal applies t exterior rear hub drum brake band. the two hand levers, that on the outsi is pulled to apply the internal emergen brakes only. The inside lever works three planes to shift the Mooers selecti gear change.

THE NORTH AMERICAN

PHILADELPHIA

Leads in Automobile Advertising

There is probably no other business in this country that entails as great an investment of capital as the manufacturing and marketing of automobiles. The automobile man deals in "futures" —he must plan ahead for the business that will come largely of the advertising he is doing now.

He must know where to place his money to the best advantage and what newspapers will produce the greatest sales.

The local agent—the man who comes in contact with the purchaser—must understand conditions. He must know the best medium to reach the purchaser. His advertising expenditures are charged against him, and in these he wastes no money.

To properly present the claims for their cars before the public, automobile manufacturers and dealers engaged 59,737 lines of space in the Show Editions of Philadelphia newspapers, Nov. 9th and 10th, apportioning that space as shown on the opposite page.

Hosted by Google

The North American 23,146 Lines	The Press 12,149 lines

The Inquirer 7294 lines	The Record 5964 lines	The Ledger 4725 lines	The Telegraph 4670 lines	The Bulletin 1879 lines

This pre-eminence of **THE NORTH AMERICAN** is not an accident. It has won for itself the respect of the investing interests of the country by its square deal policy, by barring fake financial advertising and exposing the illegitimate. Its readers believe the character of the paper is behind its advertisements.

Motor car advertisers see the advantage of this prestige. Some of the most successful place the bulk of their appropriations with **THE NORTH AMERICAN** for this reason. In the treatment of automobile news

JAS. L. GIBNEY & BRO.

The cams and cam shafts are exact reproductions and will interchange. The cam shaft material is nickel steel, 3½ per cent., and the cams are completed by local case hardening. The cam lifters, all cylindrical and all hardened, have forked lower ends, which take hardened cam rollers, about 8-10 diameter; the valve springs, tempered steel, are of the volute form, and have their lower ends bent across and passed thru slots in the valve stems. The valve action here shown has no length adjustment, but a micrometer length adjustment will be fitted in the regular commercial Thor Six. The cam shafts are on plain bearings. The cam shaft drive is from an applied steel pinion keyed on the crank shaft, direct to pure fiber cam shaft gears, not laminated with metal. The pump and magneto are driven by pinions meshed with the cam shaft gears, one on each side, in about the same relative positions. The carburetor is of the float feed type, with single standpipe, and provided with an auxiliary air intake valve.

THE CYLINDERS.

The cylinders are cast from a fixt analysis gray iron mixture, and are finished by boring, grinding and lapping; the boring and grinding are with everything machine held; the lapping is with a free, expanding, lead lap, quartz abrasive used with light mineral oil. The cylinders are finished to accurate diameter by lapping; the grinding is 2-1000ths under finished size, and the final 2-1000ths of diameter is gained by lapping with a free, lead lap, quartz and light mineral oil freely applied to the lap, which hand-traversed in the cylinder bore during the lapping operation.

THE THOR SIX-PISTON.

The grey iron pistons are cylindrical, and made in three diameters; the piston head diameter above the rings is 20-1000ths below the cylinder diameter; the two body ends of the piston are each 2-1000ths under cylinder diameter, and the relief, in the middle of the piston, is 40-1000ths below the cylinder diameter. The 3 piston rings are eccentric, 35 degrees angle cut, and are finished so as to exactly fill the cylinder, with no opening at the ring joining. The pistons and cylinders are finished before assembling, and there is no "running in" by belt-driving of the assembled engines. The piston pins are about 8-10 inches diameter, tool steel, hardened and ground, and have split ends, with taper pin and screw retention.

The symmetrical connecting rods are nickel steel drop forgings, with hardened and ground steel bushes on the piston pins, full marine type split, 4 screws with castelated nuts and split pins and flanged split anti-friction metal boxes on the crank wrists, with one-piece brass liners between the box halves, no closing possible without taking metal off the liners.

THE CRANK SHAFT.

This is nickel steel, heat treated and tempered, wrists and bearings 1 21-32 diameter. The crank shaft bearings are imported, annular ball bearings, 13-16 balls.

THE THOR SIX BASE.

The motor base is a four-piece aluminum casting, one for the motor base proper, two for the cam shaft housing, and one for the oil basin below, which has 3 oil pits, with one overflow stand-pipe in each. The lubrication is splash, and the clutch is a 9½ degree cone, 15½ inches large diameter, leather faced, with cork inserts.

The machine work of this motor as shown at the Palace and Garden, 1907, is of the very best quality.

Track Racing Question Remains Unsettled

The question as to whether automobile racing on horse tracks is to be or is not to be continued, is still undecided. The special committee appointed by the American Automobile Association made a report in which it gave no definite decision in the matter.

The report seems to be much of a straddle inasmuch as a large majority of the organizations affiliated with the A. A. A. voted against sanctions, while comparatively few voted for sanctions.

Automobile track racing if continued under the sanction and approval of the A. A. A. will be completely revolutionized in respect to methods of conducting such events and restrictions imposed.

The publication known as The Power Wagon, which is published in Cleveland, O., will hereafter be located at Chicago, Ill., with offices at 21 Metropolitan Block.

A continual decline is shown in import statistics from month to month. The month of October shows a shrinkage of $217,586.15 in comparison with the imports of the corresponding month of last year. The number of automobiles entered was 202, or 18 less than October, 1906, the appraised value being $591,466.84, as against $809,052.78.

The January number of the Journal will be the 'Great Buyers' Guide Special," containing as it will a directory of makers of motor cars, motor boats, parts, accessories, etc. All firms listed in the directory will appear under suitable headings according to their products, all makers of each particular product appearing in alphabetical form under that heading. No extra charge is made for this valuable feature, and single copies of the January number may be had for 20 cents, or we will start subscriptions with the January number for all who remit $2.00 promptly before the edition is all bespoken.

A Strong Statement—but a True One about the

The distinguished successes of the present automobile season, you can name on a very few fingers. And however you name them, the Elmore must come first.

First, we mean, in point of swift sales; the quick clean-up of the entire output; the call for more cars than our big plant could build; and the magnificent satisfaction which every Elmore in use is giving its owner.

Each Elmore season has surpassed the previous one---each year has seen its prestige grow greater and greater and greater.

In 1908, we promise you that the Elmore will be the most perfect car of its class in America.

WHAT IS THE LIMIT OF ENGINE SPEED?

Provo, Utah.

Enclosed you will find a sketch of a 6 by 4 in. cylinder for either a 2 or 4-cycle engine, with a 6 in. between centers connecting rod. Will you kindly answer the following questions:

1. Is there a limit to the speed of a gasoline engine? Why are not speeds above 2000 used?
2. Why is large bore and short stroke not used?
3. Why would this increase the ratio of power to weight?

T. J. NEUBAUER.

Your question is quite a pertinent one. Most builders have assumed that things are impossible because they have not been done before. Gas engines have usually been heavy and with small bearings and so would not stand the speeds at which steam engines were run. Daimler and De Dion abroad and the Duryeas on this side of the water simply cut loose from tradition and produced the light engine now so common in auto service and without which the high speeds and great flexibility needed could not be secured. But I do not believe that we have reached the limit. With better steels it is possible to go much farther. Their use in themselves permit both lighter weight and higher speeds. I see no near limit if the engine is designed correctly. We hear of engines running up to 3000 R. P. M., and why it should not be a regular thing I do not know. The piston speed is assumed to be the limiting factor, but with better oils than in the past even this is less true. Formerly 600 ft. per minute was considered fast enough, then 750 was assumed to be about the right thing, but now the H. P. formulas are based on speeds of 1000 ft. per minute. 6-inch bore and four-inch stroke was used and gave good service on a Lambert auto this last year. They have increased the stroke to four and a half for next year, but have another with 5 in. bore and 4 in. stroke, so it is quite evident that they do not regard it as bad in any way. Several other makers use strokes shorter than the bore. Precedence is the only thing I can think of that keeps the short stroke from being used more. It makes a very short and light engine and gives greater flexibility than a longer stroke engine. It must be made more carefully, for it is evident that with a larger circumference the leaks will be more if the fits are not good. High speeds also require better carburetors than common and good carburetors have been hard to get in the past. People have put much money into needless things like speedometers and neglected the very thing that saves most time by furnishing a proper mixture so the engine can do its work well. Proper sparking is pretty well understood, but the carburetor has not until lately been considered enough to result in much betterment. Yet it is vital to a high speed engine, for if the mixture is not right it cannot burn quickly and so no power follows. Practically all carburetors require a higher vacuum at high speeds than at low, but at high speeds the great trouble is to get in a full charge and so the vacuum should not increase. Some engines do not get half a charge at high speeds and this is largely why the power does not increase as does the speed. Some engines have the charge forced into them, and these certainly can get a much higher speed than common. However, your connecting rod of only 6 in. in length is too short for the bore and would give excessive side thrust in the cylinder.—C. E. D.

TO REMOVE CARBON DEPOSITS.

Milwaukee, Wis.

Finding your department in the Auto Cycle & Trade Journal indispensable, I beg leave to inquire how I can clean cylinders in a 2-cylinder opposed motor, same being carbonized? Have used kerosene, but too late, as the carbon has already become hard. I find my engine knocks at times, so I suppose this is the fault coupled with that of the timer, as I have to keep the spark down.

A. T. HOFF, JR.

There is no known and practical solvent for carbon. When it is baked in place the best way is to scrape it off with a table knife or some tool of this kind. Some makers like the Marmon, have kept this method of cleaning in view in designing and have made the heads of the cylinders easily removable so as to facilitate cleaning. Kerosene is good before the carbon has baked in place, for it cuts the heavy oil and lets the solid particles wash away. A good part of the so-called carbon is often road dust which has been sucked into the cylinders thru the intake and is caught by the oil on the walls. The intake pipe should have a large area of knit or loosely woven cloth to cover its entrance, and this should be washed frequently so as to prevent its becoming so completely filled with dirt as to add much resistance to the passage of the air.—C. E. D.

BEARINGS WORK LOOSE.

Doniphan, Neb.

Will you answer thru your excellent journal the following questions: I have a 5 in. x 7 ii. opposed double cylinder auto engine that is giving me lots of trouble. What I would like to know is, would it make the engine run better if I changed the stroke to 6 in.? At present it is almost impossible to keep the bearings tight on the crank shaft end of the connecting rods which are bushed with babbitt metal. I have tried several kinds but get no better results. They will pound loose in a few hours. I never run the engine over 800 R. P. M. and less on the road under load. I sometimes think the compression is too high. Would that have a tendency to make it pound or is the stroke too much for bore of cylinder and speed of same.

HARRY WILSON.

I cannot tell from your description whether the fault is too high compression or whether it is in some other part of the construction. Possibly the bearings are too small and too short. The piston speed is not unduly high. If the pistons are very heavy it increases the load on the bearings. See that your cooling system is in good order so that there are no pre-ignitions. If there are pre-ignitions it puts a very heavy load on the bearings, and this probably causes you the trouble. If you have no pre-ignitions, then you need not think of lowering the compression by shortening the stroke. I think you can lower compression by putting plates under the cylinders so as to make them stand farther apart. If the fault is in the bearings, several things that are less cost than a new shaft can be done. First be sure that the crank pins are parallel with the crank shaft, for if they are not they do not take the load evenly all over the bearings and one part cuts while another is not even bearing. A smaller true pin will serve better than a large untrue one. A few small oil grooves in the bearings parallel to the shaft and not diagonal as is common, will often remedy the trouble. Bronze bushings instead of babbitt will often stand up under abuse that the babbitt has not sufficient strength to take. If you still fail to make it stand up as it should, there are two or three tricks that will help. Bore out the bearing for a pin of ¼ in. greater diameter and put in a loose bushing ⅛ in. thick. This will more than double the bearing surface and the bushing will travel around at some intermediate speed and by reducing the speed of the surface contact will stop some of the wear. If you do not have room to bore out the bearings so much a thinner bushing will do. I have used bushings of thin spring steel so thin that altho formed in a single piece they could be sprung into place on the pin. These stopped the trouble because they divided the work between two surfaces.—C. E. D.

WANTS FORMULA FOR RATIO OF ENGINE TO REAR WHEEL SPEED.

Ashtabula, Ohio.

Will you give me a rule in your next issue to find the ratio of gearing engine to wheels, engine steam 40 I. H. P.? Wheels, 36 in.; weight of car 3000 or 4000 lbs.

ENGINEER.

I do not remember any rule for your purpose. You can approximate what you want as follows: Assume a draw bar pull of 50 lbs. per ton for good macadam roads and two to five times that for worse roads. If you expect high speed, an addition must be made for wind resistance; 4000 pounds will require 100 lbs. pull at the top of the wheel to propel the vehicle. If you want 30 miles per hour you must pull that wheel a mile in two minutes, or 2640 ft. in one minute. This distance multiplied by the pull required, is the foot pounds per minute that your engine must develop; 264000 divided by 33000 gives 8 as the H. P. required. If your engine gives 40 H. P., it does not mean that you can go five times as fast, but that you can go on roads that are so bad you require a draw bar pull of 250 lbs. per ton, without changing gears. Of course the friction of the engine, vehicle bearings and similar losses must be taken into account, all of which reduce the figures. You can select sprockets of such size as seem most suitable. If the rear sprocket is half the size of the rear wheel the chain pull will be 100 lbs. per ton, and if the engine is to turn twice as fast as the rear wheel the front sprocket must be half the size of the rear. I do not see how I can make it any plainer. And when you have figured it all out, it is still nothing but a guess and of little value unless you have had experience in such things and know about what to allow for each factor that you are obliged to consider. On this account the best way is for the new man to select the vehicle that is most nearly like what he wants to build and copy it, making such allowances as any preferred changes seem to require. The safest engineers are the most conservative ones and they stick closest to what has been done before and use formulas only when they cannot get the actual example, and even then they remember that the average formula is only an aid to guessing.—C. E. D.

A REVERSIBLE 8-CYLINDER MOTOR.

Detroit, Mich.

I am designing an eight cylinder gasoline engine with the cylinders set at an agle of 90 degrees with each other, arranged four on a side, with the connecting rods of opposite cylinders working on one crank. The crank shaft I expect to make with cranks set at 90 degrees apart. What would be the order of firing the cylinders? They will fire at intervals of a quarter of a revolution. Also by using a cam shaft arranged to move horizontally to bring in another extra set of cams, can this engine be made to reverse without first stopping? I figure that a fly-wheel will not be necessary. The engine, of course, will be four cycle.

C. G. HERBERT.

The order of firing can be arranged several ways. It cannot be determined until the crankshaft shape is determined. I presume that you will use a regular four cylinder shaft and that the four cylinders on one side will fire as does the usual four cylinder engine and the four on the other side will fire just the same but one-quarter of a revolution earlier, or later. If you number the cylinders on one side even and on the other odd and fire each as a four cylinder, viz., 1, 2, 4, 3, with the cylinders on the opposite side in the same order, you will fire as follows, 1, 2, 3, 4, 6, 5, 8, 7. Or you can just as readily fire them thus, 1, 8, 5, 4, 7, 2, 3, 6. Figure it out for yourself. It is better mental training than a game of checkers. The engine might be made to reverse, but of course would necessarily have to come to a momentary stop first.—C. E. D.

GASOLINE VERSUS STEAM

Godfrey, Ill.

Kindly answer, if you can, the following questions in the next issue of the Journal: What are the advantages and disadvantages of a steam automobile? And can they be compared with the gasoline machines, or are they more difficult to operate?

C. D. FLACK.

Get the catalogs of two or three of the most prominent makers of steam vehicles and you will get about all there is to be said in their favor. Contrast the good points with the good points of the gasolines as set forth in the catalogs of their makers and you have the best answer to your question possible, for the reason that what I consider a good feature may be by you thought to be a bad one. We are not all alike and on this account the varieties of autos are sure to increase each year. This very fact will kill

the styles and then the auto will be a thing of utility and not a fad, as it has largely been in the past.

Steam vehicles use more water and fuel for the same power, have more parts, require more time to get ready, have an open flame that may be a source of fire, must have better water and cannot use a non-freezing solution or get along without water, as does the air-cooled gasoline engine, and the intense flame is often quite destructive to the boiler, with the result that more care is required usually to keep it in order. On the other hand, they are self-starting when steam is up, are quiet, can be reversed, have a much greater flexibility so they need no or less speed changes than a gasoline car, can pull hard from a standstill, can be driven slowly without stopping, and are like some little girls, very good when they are good. The steam vehicle got a black eye by being "high financed" when it was young. If the early steamers had been developed as slowly and carefully as the early gasoline vehicles were, there would never have been a boom in the business, but many more would have been in use to-day. Some users will have nothing else, but in the long run the steam engine will lose out. It has had its best day. The possibilities of the internally fired engine are so much greater and are just becoming to be realized; which means that in the near future we will have still simpler and better ones and the steam engine will be left further behind in the favor of the public.—C. E. D.

WHICH CAR FULFILLS THE CONDITIONS?

New York.

Will you kindly state which valve you think is better and reasons, the bevel seat used on most American cars, or the flat valve used on the Mercedes and Bianchi?

Do you know of an automobile engine combining the following features and will you please express your opinion as to whether they are good or bad?

(1) Six cylinders, cast separately. (2) Valves on opposite sides and mechanically operated. (3) Make and break ignition, with magneto and battery. (4) Water cooled, pump and fan. (5) Governor, and hand and foot throttles. (6) Engine supported at 3 points. (7) Horsepower about 35. Engine to be used in connection with multiple disc clutch and selective transmission.

I shall look forward to your next issue in hopes that it will contain an answer to the above. WM. E. WARDLAW.

The bevel seat is best because it offers a more nearly straight path for the gases. It is also slightly smaller and lighter. Many forms of seats have been tried and some are made spherical, but there is little gain to pay for the additional trouble. Any are good if the size and workmanship are right. I do not remember such an engine as you suggest. You may find one at the shows, which will be nearly over before you get this. Six separate cylinders are all right if you want that many. I prefer less. I do not favor opposite valves because they require two ports, and one is necessary evil enough. I can run an engine as fast as I think it should be run without lifting the inlets mechanically and so can see no use in adding this complication. For special work, like racing, where every ounce of power and speed is wanted, it is all right. A little larger charge can be introduced if there is no valve to be sucked open. Your ignition suggestion cannot be beaten, altho there are plenty of good jump spark devices now. There is no use for a governor, for you can set the throttle where wanted and the engine will not vary much if your carburetor is good. The finest adjustment can be done by hand, so a hand throttle is preferable. A foot throttle necessitates sitting in a fixed position and makes driving more fatiguing than it need be. Your remaining suggestions are all right.—C. E. D.

TEMPERATURE OF PRE-IGNITION OF VARIOUS FUELS.

St. Louis, Mo.

Through the medium of your journal, kindly inform me at what pressures per square in and at what temperatures Far. pre-ignition will take place in the cylinder of an internal cumbustion engine when said engine is using the following fuels: gasolene, kerosene, alcohol? A. V. REYBURN, JR.

No stated pressure and temperature can be given, and even if they were, they would only apply to the exact conditions under which they were found. A different design of engine would change the result and render the information of little value. I do not have a report at hand just now, but you doubtless know that gasolene pre-ignitions are quite common in engines that use pressures of 75 pounds or more. Kerosene ignites easier and so ought not be worked at over 60 pounds or thereabouts; while alcohol will stand pressures twenty or thirty pounds higher than gasolene. These pressures apply to water-cooled engines. They are lower for air-cooled and vary of course with the temperature of the compressed charge. The Diesel engine starts with a cold charge, and I understand uses pressures up to 500 pounds.—C. E. D.

FORMULA FOR DRY CELLS.

Gloucester, Mass.

Having been a subscriber to your magazine for several years, I desire to know if the formula used in making dry batteries is secret? If not, will you kindly publish the same in some future edition of the Journal?—E. S. T.

Most dry cell makers have a formula of their own that they like to consider as secret. Dry cells are simply galvanic cells, and are not essentially different except in the quantity of moisture. If perfectly dry they furnish no current, and this is one reason why old cells are not so good as new ones. Ordinarily zinc, carbon and sal ammoniac are the essential features. Black oxide of manganese is used as a depolarizer, and this is usually mixed with granulated carbon which much increases the carbon surface while a little graphite insures conductivity. A zinc cup is lined with a porous cup of blotting paper, the carbon put in the middle and the mixture described, moistened with a solution of sal ammoniac, is packed tightly and evenly around the carbon, filling the cup tightly nearly to the top. A layer of melted pitch and asphalt is poured on top to hold the mixture in, and generally a hole or two is left for the escape of gases. Great care should be taken to get a good metallic connection with the top of the carbon. Pure sal ammoniac and pure zinc are advisable. Solder inside starts local action, and soon ruins the cell. A strong solution gives a large output for a short while. Some cells are moist enough to leak when laid on their sides. Water is formed in use, and a short circuit is often indicated by the cell running over.—C. E. D.

Several changes have recently been made in the executive committee of the A. L. A. M. F. L. Smith, of the Old Motor Works, has succeeded M. J. Budlong and F. A. Babcock, Babcock Electric Carriage Co., has succeeded C. Arthur Benjamin as director. B. F. Everitt, Wayne Automobile Company, and C. G. Stoddard, Dayton Motor Car Company, were elected to membership in the association.

2 Cycle Engines

HUGH DOLNAR.

HORSE POWER OF OPPOSED MOTOR.

Please pardon my troubling you, but I knew of no one, who I thought would know as well as yourself, about the following:

What is the highest H. P. that a 4x4 double opposed engine, water cooled, will develop? Is it possible or what is more to the point, can it deliver 18 H. P.?

JOHN P. BATES.

It takes 2 cylinders to make an opposed motor, consequently a double opposed motor would of necessity have four cylinders, and four 4x4 cylinders, four cycle, can give 28 or 30 H. P., or perhaps something more if made with large valves and given full charges of fuel. You do not specify 4-cycle. If you are thinking of 2-cycle engines, 4-cylinders 4x4, 2-cycle can be made to give from 50 to 60 H. P., probably. If you mean a pair of opposed cylinders 4x4 in., 4-cycle, as I guess you do mean, the ordinary rating is from 12 to 14 H. P. With large valves, full cylinder charges, high compression, say 90 lbs., and 2000 R. P. M., all possible conditions, such a motor might have 130 lbs. square inch mean effective pressure which would give 1625 lbs. on each piston by 500 effective 4 inch strokes per minute and divided by 12 to give foot-pounds, and by 33,000 gives 8.35 H. P., for each cylinder, or 16.7 H. P. for two cylinders, 4x4 ins., 90 lbs. compression, 2000 R. P. M., neglecting friction, which is high in a small engine, and would make 14 B. H. P. a liberal estimate for a pair of 4x4 cylinders at 2000 R. P. M., 4-cycle.

I should say that a 4x4 opposed cylinder motor, might, possibly, be made to show 18 B. H. P. I would also say that 12 B. H. P. is as much as can be expected from such a motor under favorable condition of actual work in a motor car, on the road.

Of course, 2-cycle would double this, same superlative conditions.—H. D.

HENDERSON TWO-CYCLE ENGINE ANTEDATED.

Los Angeles, Cal.

In the "Trade Journal" of Oct. 1st, there appears what purports to be a new system of portage for two cylinder engines devised by Mr. Henderson. There are a number of points about this device which are certainly new and novel, such as the admission of pure air into the top of the transfer tube, and the pivoting of the connecting rod in the upper end of the piston. The idea of the transfer tube attached to the top of a piston and discharging at the upper end of the combustion chamber is not new, as the writer has used this device for several seasons, and the results have been highly satisfactory. While the engine has seen actual service, it has not been marketed in a commercial way as yet. neither did I have an opportunity of carrying my exhaust ports clear around the cylinder, as I took an old Sintz engine, using the original exhaust ports, casting a new head and piston for the purpose of working out the idea in practical service. I have since constructed a machine using the lower end of the cylinder as a compression chamber with the tube transfer to the top of the cylinder. I have had no trouble whatever from back fire, strictly speaking, altho I have had considerable trouble with premature explosions due to the overheating of the transfer tube and the port projections on the cylinders. I am now experimenting with a view to remedying these troubles, and will be glad to give the "Journal" readers the benefit of my experiments, if I get results that are worth reporting.

JAS. M. SHUCK.

NO ADVANTAGE IN MOVING CYLINDER.

San Francisco, Cal.

I have designed a 2-cycle motor where the piston is stationary and the cylinder moves on slides as in steam practice. Is this objectionable in a gasoline motor? I can see no objection except in weight of cylinder compared to piston as a moving part. If this is no drawback, I have a perfect 2-cycle motor. Please answer through the Trade Journal.

A. PHINNEY.

What do you gain by a stationary piston and moving cylinder? You would certainly lose in every direction, so far as I can see. A large steam engine built in Chicago, moved both cylinder and piston incorrectly supposing that they would gain double power by using the cylinder head pressure. Your scheme seems to have no recommendation at all. Of course, the Chicago engine was a misconception and a failure.—H. D.

Difficulties Successfully Overcome by Users

Under the above heading we will be pleased to publish how *you* solved *your* automobile difficulties. Many troubles have been successfully overcome by means of the answers in these columns. We earnestly urge those who have been thus benefited or any who have overcome such difficulties to send a brief account of the same to the Editorial Department of the Cycle and Automobile Trade Journal.

AN EXPERIENCE WITH PISTON RINGS.

Lampases, Tex.

The "Journal" has been of great interest to me, and much valuable information has been found in your Mechanical and Technical Department.

I read not long ago a question and its reply therein relative to the proper space that should exist between the ends of piston rings in small gas engines. Here let me say that I do not wish to criticize Mr. Duryea's recommendations, for I am aware that what might work to great satisfaction in one engine might not give any kind of satisfaction when applied in another engine. What I wish to do, is merely state certain experiences that I have had in the fitting of rings in gas engine cylinders, and if any one is benefited I shall be satisfied.

The engine in question was a 4-cycle low compression multiple cylinder affair that ran hotter than usual on account of the design given it by the maker, which, so they claimed, made it more economical in fuel, and I cannot dispute this claim, for it seems to do more work than others I know of with equal fuel.

When the auto containing the engine had traveled 1384 miles there was next to no compression in one of the cylinders, which I shall hereafter refer to as cyl. No. 1. Being a machinist by trade, having had some experience in fitting packing rings and having facilities for making a good set of rings, I determined to depart somewhat from what I believe is the general rule.

Ordinarily piston rings are so fitted that the ends are apart from 1-64 inch to 1-16 inch. I reasoned that the more space between the ends, the more leakage, for while the origi-

vill solve the power problem for you. We have models to suit equirements of the automobile builder.

Our horizontal ball-bearing mo two cylinder, 5½x5, 20-24 H. P. is pecially adapted for shaft drive or ch drive. The two cylinder 5x5 engin an ideal equipment for runabouts.

For touring cars of from five to seven passengers, the standard type is our four cylinder, 5x5, 40 H. P. motor. This is a triumph in motor building, being powerful, silent-running and reliable.

For high-powered runabouts or light touring cars, as the A car, Pope Hartford, Etc., our four cylinder, $4\frac{9}{16}$ in. bore x 4 stroke is unsurpassed.

We furnish Motors and Transmission Gears complete on steel frame or pre

Digitized by Google

nal rings seemed to open out and fit the cylinder walls good and snug, yet there was a blowing of the compression past them where the ends of the rings were even when the engine was hot. The piston was taken out and the cylinder carefully measured with an inside micrometer, and it was found that the cylinder had worn tapering, largest at the end nearest the cylinder head. I found that the head end was nearly 0.004 inches larger than the other end. Expecting that rings might eventually have to be made for all the cylinders, I made a simple arbor chuck for holding the rings while the sides of same were being finished, which was done in a universal grinder, thickness of rings not varying more than one-half of a thousandth inch. Another arbor chuck was made that held the rings by their edges after they had been compressed till their ends came together. This chuck was for holding the rings while they were being finished on the periphery, which operation was also done in the grinder. The arbor chuck was held between dead centers, hence it was possible to remove the chuck and try the ring in cylinder, if desired. With ends of the ring as close together as they could be drawn the periphery of the ring was ground off till it would just slide into the cylinder easily and come to a stop when it had slid down 1-16 inch farther into the cylinder than the piston would carry it. On account of the slight taper of cylinder, 0.004 inches in about 5½ of length, the chuck containing ring would easily slide in, as nothing but the ring touched the cylinder, until the ring reached that part of the cylinder whose diameter it equalled. Then it would go no farther. Each ring was fitted to pass into the cylinder the distance that it would be carried when in its groove in the piston, plus 1-16 inches.

The emery wheel used, trued with a diamond pin, left a fine finish, and while very true and smooth, yet there were fine marks visible to good eyes. Of these marks I speak later, and they must have been less than 0.0001 inch in depth. I had some misgivings as to how the rings would work when fitted so closely to the cylinder, with their ends touching each other, and was very careful at first, just running the engine long enough for it to get warm, next time ran it a little longer, and longer each time after until I thought it might be safe to take a short ride without danger of the rings striking and ruining a cylinder. But never did those rings offer to stick.

After running the vehicle 2293 miles the rings in another cylinder no longer held compression as they should (will call this cylinder No. 2) and as such good results had been obtained from the rings in cylinder No. 1, cylinder No. 2 was fitted with a set of new rings in a similar manner. All rings ground till they would just slide into the cylinder 1-16 inch farther than the piston would carry them. At 2293 miles the rings in cylinder No. 1 were examined, cleaned and washed in gasoline. Tho they had run the vehicle 909 miles, yet the very fine marks made by the emery wheel were still visible over the entire surface of all three rings. To anyone familiar with finishing by grinding I will say that the finishing wheel was a Norton vitrified wheel, No. 120 grit, work speed and feed the best I knew for producing the most accurate surface. The rings in cylinder No. 2 were used as in the first case and no trouble at all resulted from the close fitting of the rings in either cylinder. At 3328 miles the rings in a third cylinder were replaced. At 3329 miles the rings in cylinder No. 1 showed the small emery wheel marks over at least 2-3 of their surfaces and had been used to drive the vehicle 1945 miles. Rings in cyl. No. 2 showed the small emery wheel marks over their entire surfaces and had run the vehicle 1036 miles.

I am of the belief that the metal of which the rings were made was of slightly harder iron than that in cylinders, tho the difference, if any at all, was very little. Each time the rings were taken out and wear noticed, the cylinders were carefully measured and compared with the original measurements, and in each instance the difference was found to be negligible, never more than 0.001 inch increase in cylinder diameter.

At 4785 miles a tour was contemplated and everything was desired to be in best shape for starting out. As the engine was known to need scraping to remove accumulated carborn, it was cleaned. Rings in cylinder No. 1 still had emery wheel marks on at least 1-3 their surfaces, rings in No. 2 showed even less wear than rings in No. 1 after a corresponding use, and rings in No. 3 had emery wheel marks on at least 3-5 their surfaces. As the compression seemed all that could be desired, I didn't take the trouble to measure and compare the wear that had taken place in the cylinders, but don't think it had been any more than had occurred formerly from corresponding use.

This proves to me that in some cases piston rings can be fitted very closely to cylinder walls, in fact much closer than is done ordinarily, and give satisfaction. It does not prove that the same satisfaction would result in all cases. Five months after putting in the rings in No. 2 I had a job fitting rings in all the cylinders of another engine, which was of same make as my own, and tho supposed to be of same dimensions, I found that the cylinders had been originally about 1-10 inch larger in diameter. After advising with the owner, I fitted similar rings. After using his car for several hundred miles he wrote the rings were satisfactory.

The stroke and bore were equal, 4½ inches each, rings were 4.72 inches in diameter before cutting, which was straight diagonal cut of 45 degrees done on the grinder in order to get ends square and true, rings eccentric, and all ⅝ inch wide. At 4785, after rings in cyl. No. 1 had run vehicle 3401 miles, I revolved piston in cylinder till the ends of lowest ring showed at a hole in which an oil cup screws. The space between ends of rings was measured with a thickness gage and found to be less than 0.008 inches. The mileage given is actual, as read from an odometer.

TOM HULING.

A PECULIAR PREDICAMENT.

The writer while taking a short pleasure drive not more than twelve miles out of the city, upon one occasion encountered one of those long hills built on the installment plan, and as each sharp rise seemed to be the last was congratulating himself upon the manner in which the small 4-clinder air cooled motor was "doing itself proud," when another and steeper incline presenting itself, the clutch apparently began to slip and the car refused to take the grade, altho the motor was running well. The low gear was thrown in, but with unsuccessful results, as there appeared to be a decided slip somewhere, altho at times the car would start ahead.

It was decided to readjust the clutch, which was of the leather faced cone type, and this was done. Another attempt was then made, but with the same result. We then removed the foot boards and after inspecting the clutch decided that it was in as good working order as usual, in fact that it was gripping very hard and after the nature of many of its kind altogether too suddenly. As the universal joint, there was but one, seemed intact and likewise the change gears and as far as could be determined the cardan shaft, I decided to watch the car from the ground while my companion again essayed the hill. To my surprise I found the hub of the right rear wheel turning around while the spokes and rim remained practically stationary. Others who have been in a similar predicament know the cause, a defective hub casting which had cracked completely around close to the barrel leaving only the flange securely bolted to the spokes.

The question of getting home now presented

Hosted by Google

itself, as of course the other wheel would not drive. Two solutions offered themselves, first, wedge the differential so it could not act and drive with one wheel, but as the differential was anything but accessible this was abandoned; second, the wheel spokes could be gripped to the hub—but how? From the tool box a large Stilson pipe wrench was obtained and gripped onto the hub and then the handle securely wired to one of the spokes as shown. The rotation of the hub being such that it continually tightened the Stilson's grip on the hub. The direction of the hub rotation is shown by the arrow.

Stilson lashed to wheel hub for driving.

After all was in readiness the car was pushed by hand to start it, so there would not be too much strain on the wrench, but the "fierce" clutch was the rock upon which we split, and so did the Stilson, for the handle was broken short off by the sudden twist when the clutch engaged. However, as we were now headed down the hill we managed to keep moving, and by the use of the low gear when on the level and the fact that the slight wobble of the wheel wedged the hub sufficiently so that it drove occasionally, we managed by avoiding the hills to reach the city. It is needless to say a new hub was supplied by the makers free of charge.

E. STILLMAN.

EFFECTIVE ANTI-FREEZING SOLUTIONS.

As the cold season approaches the usual quest for good non-freezing solutions increases. The following are some that have been used with success; equal parts of alcohol and water, and as alcohol can be obtained in quantity for 37 cents per gallon this removes the chief objection to its use as a non-freezing agent, the previous high cost as it will gradually evaporate and needs replenishing. However, it is now cheap and cleanly. Ordinary commercial glycerine one-third, alcohol one-third and water one-third has given excellent results. Three-firths glycerine and two-fifths water works very well, but care must be taken when using glycerine that the pipes, tank and radiator of the motor system are clean and free from alkaline substances possibly left from former non-freezing solutions. Such foreign matter will affect the glycerine and cloud or thicken it. The general opinion seems to be in favor of alcohol and glycerine in preference to alkaline solutions, altho many have used these with success. The "Trade Journal" will be pleased to hear from its readers in regard to non-freezing solutions, and will place in this department with or without your name as desired such information as may be sent.

A large contract by the Maxwell Briscoe Co. for denatured alcohol has been closed with a Tacoma firm which is beginning the manufacture of industrial alcohol out of sawdust that is obtained practically without expense in the lumber regions of Washington.

REMEDY FOR A SLIPPING CONE CLUTCH.

Nearly every automobilist at times is troubled with the slipping of the clutch, and some have been known to use dust from the road, others rosin, chalk, etc. A very good, in fact, about the best remedy is to apply the residue from the calcium carbide tank. This powder is usually to be had and answers the purpose admirably without any injurious effects.

Drivers who are troubled with cold feet from contact with the cold metal of the foot levers will find that ordinary tire tape wound around the pedals will overcome this difficulty and at the same time provide an excellent adhesive surface upon which the feet will not slip.

COPPER AND ZINC ALUMINUM ALLOYS.

Fostoria, Ohio.

There seems to be a general controversy regarding the alloy of aluminum known as No. 12 and the zinc alloys. This is rather amusing, but unnecessary, as each has some advantages peculiar to itself. No. 12 is light, and No. 31, (a copper and zinc alloy) is strong. Where lightness is the first consideration No. 12 would naturally be preferred, and where strength is of greater importance No. 31 would be preferred. No. 12, as is known, is an alloy consisting chiefly of copper and aluminum. Copper in aluminum makes it hard, and when used in excess makes an extremely brittle casting. Zinc toughens aluminum, but when used in excess acts somewhat like an excess of copper, making a brittle casting.

The alloy which we have accepted as our standard is an alloy which contains both copper and zinc in proportions to give a casting which is strong and which has a moderate degree of lightness. We make any mixture, however, that a customer may desire.

A word or two may also be said of crystallization. We have never had a casting made from our alloy break because of crystallization. In fact, breakage of any kind has been an extremely rare occurrence. There is such a thing as crystallization in aluminum castings. It is a peculiarity of many substances. The crystallizing of aluminum alloys is not due to the alloy, but to not understanding, or to an improper understanding of the melting and mixing of the alloys. It is supposed by some that a slight knowledge of melting metals is all that is required to cast aluminum. Nothing could be further from the truth. To properly handle this metal requires years of experience, both in moulding and in mixing and melting. This experience is ours, as the heads of our departments have made aluminum castings for six years.

One very common fault with aluminum castings is that they are often filled with blow holes. There is very little excuse for this, as they can be almost entirely avoided by properly handling of the metal and by properly making the moulds. Overheating and "burning" the metal is one cause of blow holes and improper ventilation of moulds another. More poor castings are made through "burning," however, than from any other cause.

Aluminum has come to be a standard product, not only in the automobile industry, but in many other industries where brass was formerly used. In many cases, such as name plates and other small articles it is often superior to brass, as it can be made to take a very high and lasting polish. It is also cheaper because lighter in weight. Boat fittings particularly launch fittings, cleats, chocks, post lights, etc., might be cast in aluminum instead of brass. One property of aluminum which might well be made use of is its resonance. We have not yet made any aluminum bells but think that they ought to prove very successful.

ese goods are all genuine Bargains. We purchased same at a sale and ught them at low price and will sell them at a low price. Don't wait til they are sold, order now.

50-30 x 3½ Clincher Tires $15.

After this lot is sold this will be all at this price. While our line of tires which we sell comprises the latest and most up-to-date guaranteed tires, such as Diamond, Goodrich and Morgan & Wright and while we sell principally these makes of tires and save our customers money on same, we have had calls for a cheap tire to carry as an extra or to economize on cost, and for this reason we put in a few "cheap" tires to meet the demand. The tires at $15—30 x 3½ size are certainly bargains—they are worth the money.

We have sold a great number of these tires and fitted them with the Woodworth Leather Tread, (1908 model) and our customers were more than pleased with results.

NOTE PRICES OF OUR "SPECIAL" LOW PRICED TIRES FITTED WITH WOODWORTH TREADS.

every civilized country on the face of

of delivery wagon bodies, all the sa

complete car prices are from $1375 to $1450.

The Waltham 1907 Model DLR, 96-inch wheel base, 20 H. P., 4-cylinder, 4x4¼-inch, air-cooled, will be continued for 1908, fitted with a standard two-passenger runabout body at $1750, or to order with a five-passenger tonneau body, price for the complete car $1800.

Fig. 5. Waltham 1908 Model 178, opposed cylinder motor, friction drive. The motor shaft A is pulled forward to permit the edge of the leather fiber wheel B to traverse the aluminum disc C fixed to the end of the line shaft which is always clutched to the motor crank shaft. For high speed the bevel surfaces engage and there is no slip of this bevel friction drive save in case of overload. The differential is on the counter shaft at one end as shown at D.

The only other Waltham 1908 chassis has either a single vertical cylinder motor or a pair of inclined cylinders, 3¼x4¼, air-cooled, each cylinder 4 H. P., making the pair of cylinders 8 H. P. The wheel base is 84 inches, weights of complete cars 700 pounds, single cylinder, and 725 pounds with the pair of cylinders, prices $400 for the single cylinder car, Model 18, and $600 for the double cylinder, Model 28.

This second 1908 Waltham chassis will be fitted with regular two-passenger runabout bodies, tiller steering for the single cylinder and wheel for the double cylinder.

Fig. 6. Waltham 1908 opposed cylinders motor, longitudinal, vertical section. The water-cooled cylinders are 4⅜x4 in. This motor shows maximum power at about 1000 R. P. M. The weight is 285 lbs.

Hosted by Google

LR.

All the other 1908 models offered by the Waltham Company will have a friction rive, five forward speeds and one reverse. his friction drive is the Waltham Company's own design, patent applied for, for

Fig. 7. **Waltham 1908 inclined cylinders motor,** linders air-cooled, 3¼x4 in. nominal 8 H. P. is motor is cooled by fan-vane flywheel arms ly, no separate fan being used. The friction ive shown in Fig. 11 is used with this Fig. 7 otor. This motor air cools well, is strong at 00 R. P. M. The total weight of this motor here shown is 180 lbs.

e Model 178 chassis. This drive is a rrect bevel friction drive, coacting mem-rs nearly equal diameter on high speed, d an aluminum disc with a fiber wheel, afts at right angles, for the intermediate eeds and the reverse. The high speed ive is thus without any transmission p or friction in Model 178, and has, of urse, the ordinary aluminum disc and er wheel friction for the other speeds Model 178, and for all speeds of the odels 18 and 28.

It was for a long time believed that the ction disc and paper or fiber faced co-ting wheel, shafts at right angles, had large loss of power thru detrimental p inseparable from this form of speed ange. Practice has now shown conclu-ely that this silent, simple and durable rm of friction drive can transmit as ich power from the motor to the driving heels as any form of toothed-gear speed ange, and the use of the friction gear types of speed change mechanism c bined.

BRAKES AND SPRINGS.

The brakes are all rear hub prest s drums, with internal, expanding f faced shoes, save for Fig. 3, in which brake shoes work metal to metal, Fig. 1, in which a line shaft brake dr is used with the sliding gear drive.

The axles are all steel tube, the c pany's own design and construction.

The springs are half-elliptic in fr and full elliptic in the rear in all 1 Waltham cars, save Models 18 and which have full elliptics both front rear.

CONTROL.

Model DLR, Fig. 1, has two outs hand levers, usual arrangement. T outer lever is pushed forward to dis gage the clutch and apply the brake the inner hand lever shifts the ge There are two pedals on the foot-boa

Fig. 8. Waltham 1908 new slotted arm crank steering action. This is a hand wheel a steering sleeve which has a short crank f to the sleeve lower end. The wrist of this cr works in a slotted arm fixed to the top of steering rocker, which has the globe-wrist st ing arm fixed by key and nut on the tape lower end of the vertical steering shaft. T action is peculiar in being free straight ah and increasing in power as it is moved to eit side, and being locked at its fixed greatest st ing angle if carried to the extreme. The st ing crank-radius is 1¼ in. The steering sh center is 1⅞ in. from the steering sleeve cen

The left pedal disengages the cone clu only. The right pedal is pushed forwa to first disengage the clutch and then ply the line-shaft brake.

Garford

IF a Parliament could be called of all the expert automobile builders in the world to vote on the detailed specifications for an orthodox gasolene car, we believe that the composite of their judgment would be an exact duplicate of the Garford.

Some would quarrel with the majority on one detail, some on another.

But a Garford car would be the net result.

The Garford avoids "original" features. There is probably nothing in the car which is not in the majority of other successful cars all over the world.

P.; force feed lubrication for the c nders and main bearings is used. Note the large size and the gradual increase in diame

MOLINE

THE "MOLINE" for 1908 is attractive to every one interested in the purchase of automobiles. Each machine of the line is a distinct leader in its respective class. Last season's MOLINE cars are giving their owners absolute satisfaction. The 1908 cars are the same general styles, with such changes made as have been proven to be absolute improvements. The MOLINE policy is to build cars that will give satisfactory service, and not simply to bring out a new Model for each season's Show.

Model "A", Four Cylinder, 35 Horse Power, 5 Passenger, $2500.00
Model "S", Four Cylinder, 24 Horse Power, 5 Passenger, $2000.00
Model "H", Two Cylinder, 20 Horse Power, 5 Passenger, $1250.00

Model "A" is an extremely well proportioned, high powered touring car. The wheel base is 110", the tires are 34"x4", the motor develops good liberal 35 H. P., the springs are exceptionally well proportioned, making the car easy riding, and the painting, upholstering and general lines of the car are high class in every particular. It is a car well worth $500 more than the price asked.

Model "S" is a medium powered five passenger touring car. It is the half between car. It is distinctly the machine for the man who wants something better than a two cylinder rig, and yet who does not want to pay the price of a high powered car. It is truly an every day car for the whole family. It has plenty of power for the weight, and weight enough to insure strength to carry five passengers.

Model "H" is positively the best value in the two cylinder car market. It is the result of five years of two cylinder car building. It is a larger car and more powerful than any of the earlier MOLINE two cylinder cars. The past season's use has proven it absolutely reliable in every way. Every one that goes out sells another. The success of this particular Model has been phenomenal. It is without doubt absolutely the best value in the market at the price.

All three styles of MOLINE cars are on exhibition at the Chicago Show, beginning November 30th.

Catalogue giving cuts and full particulars on request.

Stock Touring Car Race Postponed

The great international road race f stock touring cars, the first to be held this country, has been postponed by i promoters until next April. This is we however, because the season is pretty f advanced, and the early coming of t shows found our makers busy preparin them. Besides that, it takes a long tin to get out entry blanks and arrange the necessary details of the planning a final execution of a great road race.

The race will be promoted, it is said, the Metropolitan Automobile Associati of New York, aided and abetted by m who write the automobile copy for t great metropolitan dailies and such pron nent men as Robert Lee Morrell, Job Hedges and others will act as committ chairmen.

The Chicago Automobile Club is ke

er machine, known as the "Sextuplet." 'he general specifications of this car are: Vheel base, 126 inches, and tread, 56½ nches. The cylinders are cast separately, nd have a bore of 4½ inches and a stroke f 5 inches, the H. P. rating being 45, this, owever, is said to be very conservative. 'he engine is water-cooled by a centrifu-al gear driven pump and lubricated by a ill precision oiler. Ignition is of the high ension type, using Eisemann magneto nd Lacoste timer; also a separate set of atteries. The wheels are fitted with 36x ½-inch tires, the choice of any American nake being given. The car has a clear-nce of 10 inches, and weighs 3500 pounds. 'he frame is of the usual prest steel, chan-el section type, and semi-elliptic springs, 4 inches in length by 2¼ inches in width,

size and without welds. Cooling is centrifugal gear driven pump in con tion with a horizontal, flanged tube iator. The radiator and hood are dist Acme types. A 23-gallon gasoline tan provided. A perpetual guarantee as to fective parts is given with each car. Acme Company makes the broad cl that in addition to the mechanical ex lence of the "Sextuplet" it is the n complete and fully equipt car on the r ket.

THE 1908 ACME TOURING CAR.

The touring car for 1908, which sells $4000, and seats five or seven passeng has not been materially changed. motor is 4½x5 inches, and rated at 30 P. Double ignition system is suppl with current supplied by Eisemann

The 1908 Acme "Sextuplet." This 1908 six-cylinder model has a wheel base of 126 inch and a tread of 56½ inches, a four speed and one reverse selective sliding gear direct on t hird speed is used. Driving is by side chains to the rear wheels. The motor cylinders a cast separately, and are 4½x5 inches, being rated at 45 H. P., double ignition system, by Eis nann; magneto and battery are supplied. The clutch is a leather faced cone with cork inser The change gear is direct on the third speed, and the gears are chrome nickel steel mounted Hess-Bright bearings. The car has 10-inch clearance and weighs 3500 pounds, and sells f $4500, including top, two acetylene headlights, two side oil lights, tail lights, horn, tool kit a gas tank. The choice of any American lamp and speedometer are given.

e used. Two contracting band brakes d two bronze expanding brakes are used the rear wheel drums. A leather faced utch with cork inserts is used in con-ction with a four speed selectively oper-ed sliding gear, which is direct on the ird speed. These machines will seat seven ssengers comfortably, and sell for 500. The equipment consists of top, two etylene headlights, two side oil lights, l light, horn, tool kit and gas tank. The cice of any American lamp and speedo-eter is allowed the purchaser.

The cylinders are cast separately with e usual arrangement of inlet and ex-ust valves, which are interchangeable. e carburetor is a special Acme product

tension magneto and batteries. All bra are on the rear wheels, there being t separate sets, internal and external. T clutch change speed gear and method driving are the same as in the six-cylin model. The wheel base is 118 inches, a the tread is standard. This car has a 10 inches clearance and weighs 3 pounds. It is furnished with the sa equipment as the large car for $4000.

THE ACME 1908 ROADSTER.

This three-passenger model has same engine as the touring car and same general arrangement of the chas Its wheel base is, however, 102 inches, a its weight 2500 pounds. The springs

new type of radiator, in place of the known circular front, is offered as tion this season. This radiator is of removable square tube type and is ed in enamel instead of polished , and has an eliptical shaped filling f large enough size so that water can oured into it without spilling. The system remains the same, consisting

ders being in pairs and the crank shaft mounted on ball bearings. The car weighs but 50 pounds more than the 4-cylinder touring car, the weight being 3150 pounds. On this model, the chassis arrangements are practically the same as on the 4-cylinder car, the ignition, piping, etc. being identical, but a centrifugal pump is used for water circulation instead of the gear pump of the other models. The tires are 36x4½ and a particular point is made of the fact that every part of the car is mounted on Hess-Bright ball bearings, including the change speed gear.

The steering gear is this year of the

Fig. 5. Exhaust side of the Model T 6-cylinder National motor. The cylinders are cast rately and are similar to those of the 4-cylinder engine, having flattened water jackets red by expansion plates. The bore is 5 inches and stroke 5 inches. The sections of the aust pipe are free to slip in the short tubes connecting them. The water pipes and exhaust held by easily removable three pronged yokes, the pipe ends being tapered and held into taper s in the cylinders.

gear driven force feed Crandle oiler, oil passing thru sight feeds on the the leads being carried to each of ylinders, also into the crank case for h and to the clutch transmission and axle housings, thus doing away with ge number of individual grease cups. e hood design has been slightly altered it the new radiator. It has shutters is held by a large strap, there being echanical fastening devices, the hood y coming down into the proper posi- as located by dowel pins. A choice odies is offered either in curved lines n are of cast aluminum, or in the ght line effects which are sheet

worm and sector type, and the control levers on the top of the wheel are now friction retained by means of small disks somewhat similar to the construction of multiple disk clutches. This takes the place of the stationary notched sector previously used. The amount of friction is adjustable by means of a small thumb nut. The brake arrangement gear shifting levers, etc., have not been altered.

All the National Touring Car Models for 1908, seat seven passengers. The prices include a complete equipment of lamps, head lights, generator, tools and tire repair kit, etc.

This chassis is also fitted with a Roadster body and is known as Model N Road-

The Greatest Advertising Medium on Earth

The JANUARY 1908 number of the

CYCLE AND AUTOMOBILE TRADE JOURNAL

which will be known as the

Eighth Annual "Buyers' Guide Special"

¶ It will be the largest number of the year.

¶ It will be the largest number of a trade paper ever published.

¶ It will be a reference book current for one year.

¶ The circulation will be both widespread and lasting.

¶ This number will have the largest advertising patronage known in the automobile industry.

¶ It will positively be the best advertising proposition of the year.

¶ For further details see opposite page.

CYCLE AND AUTOMOBILE TRADE JOURNAL

Hosted by Google

"BUYERS' GUIDE SPECIAL"

THE JANUARY NUMBER will be the EIGHTH ANNUAL "BUYERS' GUIDE SPECIAL." *The great importance of this number as an advertising medium has become universally recognized.* The Edition of last January contained 420 pages of advertising, (a record breaker) and every advertiser was satisfied, because the "Buyers' Guide Special" is the year book of the trade and is kept for handy and frequent reference by buyers everywhere. In addition to the Directory feature (which is the classified list of manufacturers and jobbers, and their products), the advertisements are so complete and comprehensive that they practically make this edition a condensed catalog of the entire industry.

¶ *Don't overlook this great Number. Use very large space so as to fully illustrate and describe your products in full.* Write us for further particulars.

The steer- pivot has long bearing surface, and is not unted on ball bearings. This view also shows method of connecting the steering links to steering knuckle, and the arrangement on an gral spring saddle of the spring leaves. These ts are nickel steel forgings. The cross steer- rod, of nickel steel tubing, is behind the nt axle, where it is protected.

ings are fixt to spring seats that are e to oscillate upon the axle, thus giving fect freedom. The whole of the tor- n strain on the rear axle casing is en by extra strong torsion rods. Truf- lt-Hartford shock absorbers are fitted the front and the rear springs.

The drive is by propeller shaft and el gears and a torsion rod is provided take the reaction of the drive and the brakes. Rubber buffers are provided limit the deflection of the springs.

The steering knuckles and the steering ndles are made from nickel steel forg- s, and they are of very liberal dimen- ns. The front wheels run on large ball rings. The steering rod connections e large ball joints with a spring which omatically takes up lost motion. The ss steering rod is behind the front axle, s preventing damage to the steering r due to striking an obstruction. These s are made from nickel steel tubing.

THE MOTOR.

The motor is of the vertical type, the inders being separate. They are ground ooth and accurately after machining. s has been the method employed by the npany for over five years. The water kets, valve chambers and cylinder ds are all cast integral with the cylin- proper. The jackets are cast flat on side of the cylinder to permit of bring- the cylinders close together. At the

ened and ground. The forged steel c necting rod is fitted with phosphor bron bushes at both ends. The crank shaft a solid forging of nickel steel, giving tensile strength, after special treatme of over 110,000 pounds per square in All the bearings are acurately ground.

The crank shaft is supported by th adjustable phosphor bronze bearings the four-cylinder cars, and seven bearin in the six-cylinder cars. The engine controlled by a hand throttle in conn tion with the automatic carburetor. T has been improved, the mixing chamb being jacketed with hot water.

A double system of ignition is provid each being entirely independent of t other, and each having its own set spark plugs. The first system is means of a storage battery and individu unit Autocoils. The second system is means of an improved Bosch high tensi magneto.

The radiator is set over the front ax A positively driven, centrifugal wat pump of great capacity forces the wat thru the cylinder jackets, and an i proved fan, driven by a flat belt, is plac behind the radiator. The gasoline is f by gravity to the carburetor, which is l enough to be supplied even on a very ste grade and with an almost empty tank.

Fig. 6. Rear of Dash 1908 Pierce Great A row, showing the clutch and brake levers, char gear lever under the steering wheel, the eme

"Brennan" 1908 Motors and Transmissions

With 9 years experience back of Brennan motors and transmissions it is not surprising that the manufacturers, Brennan Motor Co., Syracuse, N. Y., find no need for radical changes in their constructive features for 1908. These products are therefore offered without material changes and the few changes made are but detail refinements to obtain increased efficiency. The Model 7, 2-cylinder special, now has a ball bearing crank shaft and a new design of crank case with the secondary gears in a separate gear housing on the outside of the case. The company has thoroly tested out this model for a year past and is satisfied that the ball bearing crank shaft and new design of crank case constitute a decided improvement over its earlier models. Two cam shafts are used, one for the valves of each cylinder.

Plan and Side Views of Brennan Chassis furnished with 20 H. P. plant at $1800, with 24 H. P. plant at $2000 and with 35 H. P. plant at $2700.

The Brennan No. 10 sliding gear transmission now has the operating lever inside, and is provided with a double set of ball bearings at the clutch end of the shaft.

A 6-cylinder Brennan vertical motor is included in the 1908 line. This motor has a bore of 4 9-16 inches, and a 5-inch stroke. The crank shaft has seven bearings.

The Brennan Company is also furnishing complete chasses with Brennan vertical motors and transmissions, or the motor and transmission assembled on a subframe if desired. We show herewith plan and side views of one type of Brennan chassis which is furnished in three sizes. The smallest size has a wheel base of 96 inches and is fitted with a 20 H. P. motor. Wheels are 30-inch in diameter. This chassis lists at $1800. The next larger size has a 24 H. P. motor, a 100-inch wheel base and 32-inch wheels. Price is $2000. The largest size is fitted with a 35 H. P. motor, a wheel base 108 inches long and 34-inch wheels. Price is $2700. All three of these chasses have three speed and reverse change gears, shaft drive, honey comb radiators with fans, foot and hand brakes. The change gear is of the selective, sliding gear type and has annular ball bearings. Ball bearings are also used in both axles. Double sets of brakes are used and cable equalizers are employed to assure coincident application of both brakes of each set. Under the sub-frame carrying the motor and change gear a drip pan is provided on these chassis. These chassis are shaft driven.

Three sizes of another type of Brennan chassis are also offered, rated at 45, 50, 60 and 80 horse power respectively and listing at $3000, $4000, $5000. The power plant of this type is also furnished separately mounted on a sub-frame if so desired. These chasses have prest steel frames; semi-elliptic springs, I-beam front axles; roller or ball bearing wheels; double set of brakes; honey comb radiator; prest steel dash and hood; 120-inch wheel base; 12-feed mechanical oiler; sliding gear, three speed and reverse change speed gear; jack shaft and side chain drive or shaft drive on special order.

Wm. H. Ganschow Company, 12 and 14 South Clinton street, Chicago, is doing gear cutting for the automobile trade from blue prints, drawings or complete specifications and is also prepared to furnish gear blanks. It will shortly move into a new and larger plant at Washington Boulevard and Morgan street, where with increased facilities it will be in a position to handle a much larger amount of work.

Hans Gasoline Indicator

Edmund E. Hans Co., Minneapolis, Minn., is marketing the Hans gasoline gage illustrated by one of the drawings herewith, and also shown on the dash of a car. The operating mechanism of this indicator consists mainly of a metallic float, a cord connecting this float with a pulley and a clock spring which serves to keep the card wound up upon the pulley as the float rises in the column.

The "Hans" Gasoline Indicator.

The shaft which carries the pulley is parrallel to the shaft carrying the indicator hand and has at once end a pinion which meshes with a gear on the indicator hand shaft. As the float falls in the rectangular column in the tank the cord turns the pulley and its shaft and, consequently the indicator hand shaft. This winds up the clock spring and when the gasoline level is again raised the spring unwinds, causing the indicator hand to turn back

Dash equipt with "Hans" Gasoline Indicator.

to the proper point, and also causing the pulley to revolve and take up the cord.

The gasoline is admitted to the rectangular column from the tank thru a small opening, and therefore any disturbance in the gasoline in the tank does not affect the float in the column.

A feature of this indicator is the fact that it can be placed on the dash where it is in plain view of the operator who is thus kept informed at all times of the amount of fuel in the tank.

Diamond Demountable Rim

Diamond Rubber Co., Akron, Ohio, has put out a new demountable rim for the 1908 season. One of the best features of this rim is its simplicity. The rim proper is of the usual clincher type and the tire is mounted on it in the usual manner excepting that stay bolts and valve stem come flush with the surface of the rim. This rim is simply slipt over the wheel and held by means of six small nuts and bolts

Cross Sectional View of the Diamond Demountable Rim with Tire Applied.

that extend thru the felloe transversely. From the cross sectional view herewith it will be noted that the rim proper does not come in contact with the rim on the wheel felloe, hence the two cannot become rusted together. A wrench is furnished for removing the nuts. Any regular clincher tire can be used on the rim, which is furnished usually in sets of five, one for each wheel on the car and one for a spare tire for emergency use. Prices of single rims range from $6.12 to $7.50, and for complete sets from $58.52 to $67.90. An extra charge is made where the Diamond Company applies the rims to the wheels.

H. T. Kehew, formerly auditor of the Crucible Steel Company of America, has resigned that position to accept the office of secretary and treasurer of the Pittsburg Automatic Vise & Tool Company, of Pittsburg, Pa., makers of the Pittsburg swivel vise.

The "Stick Tite" Bow Separator, which we described in our September, 1907, issue, page 172, is now manufactured by W. J. Decker, 10 West street, Utica, N. Y. He advises us that he is the inventor of this separator, and that he was formerly connected with the Michigan Top Co., but is now in business independently. Sample sets of these separators are furnished at $1.75 in brass and $1.25 in Japan finish. In lots of ten or more, prices are $1.50 and $1.00, respectively, for the brass and Japan finishes.

The Unterberg and Helmle High Tension Magneto

HUGH DOLNAR.

The J. S. Bretz Company, Times Building, New York City, are the sole American agents for this new appliance, which is manufactured at Kalsruhe, Germany, and is the latest and most complete development of the hight tension magneto.

All the Unterberg and Helmle magnetos produce an arc-flame, instead of a single instantaneous spark, this flame being the most efficient charge-ignition agent now known.

HIGH TENSION MAGNETO REQUIREMENTS.

The arc-flame producing magneto must meet three requirements. (a) The armature must have a sufficient velocity while passing between the fields when starting, irrespective of the motor crank-shaft velocity; (b) The primary current must be broken when the armature is passing at high speed between the fields, and (c) the primary current conductors must terminate in a condenser to avoid a detrimental spark at the primary break.

After a start is effected, the armature must, of course, have a fixt ratio of revolution to the turns of the crank-shaft.

SPEED RATIO OF CRANK-SHAFT TO ARMATURE SHAFT.

The armature windings pass under the pole pieces twice in each turn, and each time a spark may be produced; hence if the armature shaft is given even turns with the crank-shaft the possible two sparks can fire the 4-cylinder motor charges as required. For six cylinders the armature shaft must make one and one-half turns to each turn of the crank-shaft.

THE DISTRIBUTOR.

Having obtained a suitable number of secondary current effects per turn of the crank-shaft, it only remains to provide mechanism for conducting these secondary electrical effects to the respective spark plugs in suitable sequence to complete the possibility of correct ignition of the motor charges by the arc-flame.

The commutator, or distributor, which directs the current to the proper spark-plug is combined in one structure with the magneto, as shown in the illustrations herewith. This distributor consists of a revolving brush which is charged with the high-tension current and delivers this current to stationary terminals, each wired to its own spark-plug, as the brush comes into successive contacts with these fixt terminals.

Fig. 1. The Unterberg and Helmle Magneto longitudinal, vertical section save the Armature, which is shown in exterior view. A, Magnets; B. Fields; C, Field-gaps; D, H-armature; D. P., Primary winding; D. S., Secondary winding; E, Armature shaft; F, Armature driver; F 1, Coupling spring; G, Primary conductor; G 1, Interruptor block; G 2, Condenser; J, Armature collecting ring; J 1, Brushes; J 2, Distributor collecting ring; J 3, Revolving distributor brush. The device at the right end allows the armature to rotate at the proper speed when driven by the engine, but when cranked by hand the armature is snapt by the maximum current points by a spring, thus giving an arc-flame even at the slowest speeds.

The current generator consists of the compound permanent magneto, A, standing upright, (see Fig. 2) and having the two fields, B, B, fixt to the two lower ends of the three compound magneto, A, made in 6 pieces for convenient construction. The fields, B, have curved inside faces to conform to the path of rotation of the H-armature D, and C, C, mark the gaps between the fields. The primary coil is marked D, P, and the secondary coil D, S,

Hosted by Google

THE NEW STARTING FEATURE.

The novel feature of this magneto, the starting device is shown in three positions in Fig. 3, that at the left being the starting position; the middle, the releasing position, and the right, the running position. The armature shaft, E, is not geared

Fig. 2. The U. and H. high-tension magneto, vertical cross-section, thru the magnets, fields, H-armature and the low-tension and high-tension coils, the coil wires being shown as of much larger diameters than those actually used. A, Magnets; B, Fields; C, Field-gaps; D, H-armature; D P, Primary winding; D S, secondary winding.

directly to the motor crank-shaft, but is driven thru devices which hurry the armature in passing the field-gaps when cranking the motor to start; as soon as the motor starts the accelerating devices are automatically made inoperative and the armature shaft is then driven at its ratio speed so long as the motor continues to run itself. This "starting device," is found in this U. H. magneto only, and makes ignition certain no matter how slowly the motor crank-shaft may be turned by the starting-crank.

This starting device consists of a driver, F, geared to the motor shaft to turn at proper ratio, a coupling spring, F 1, which is a coil of strong wire having one end fixt to F, and the other fixt to F 2 a flange which is fixt to the armature-shaft. F 2 has a radical slot in which a ⅜ diameter steel ball F 3, is free at all times to move up and down, save for gravity and centrifugal force; when F2 is at rest with the ball-slot vertical, the ball F 3 lies at the bottom and can strike a projection on the coupling spring F 1, in tension, until the stop-ring F 4, so as to lock F 2 from turning while F continues to turn, placing a depression F 5, in the left face of F reaches the ball F 3, when the ball moves to the right, relasing F 2 and the spring F 1 rapidly snaps the armature past the pole-gap and the speed of the armature is of course independent of the speed at which the crank is turned. When F is turned at sufficient speed the ball F 3 flies out to the outer end of the ball-slot, outside of the ball-stop and stays there where it cannot touch the ball-stop, so long as the motor runs.

The top of the ball-stop is a wedge which lifts the ball in its slot when F is turned the wrong way, so that no stress can be placed on the spring F 1.

The effect of this combination is to snap the armature past the field gap at high speed by spring tension when the motor crank-shaft is turned slowly and to drive the armature at its regular speed when the motor runs, so that the arc-flame is produced at all speeds of the crank-shaft; all other magnetos must be turned at a certain rate of speed before the arc-flame can be produced, which is often difficult with hand cranking.

Fig. 3. The positive starting device of the U. and H. magneto makes it possible to start the motor with a half turn of the starting crank. The device is in operation only while the motor is being started, being automatically disengaged the instant the motor picks up speed, as described in the text. The rate of speed of the armature during this partial revolution is entirely independent of the speed at which the motor is being cranked, the quality of the spark, therefore, being a constant.

Hosted by Google

il being grounded on the armature. This imary conducter G, tends thru suitable sulation to the interrupter block G 1, hich breaks the primary current at the oper times, and the condenser G 2, at e left, the other end of the interrupter well as that of the condenser being ounded to complete the circuit.

THE HIGH TENSION CIRCUIT.

One end of the secondary coil is con-cted to the ground of the low tension ll. The other end of this secondary coil connected to the armature collector-ng, J, whence the ceurrent is taken by e brushes, J1, to the distributor collector-ng, J 2, which is, in turn, connected to e revolving distributor-brush, J 3, by hich the high tension current is trans-rred to the proper spark-plug connection.

BACK-FIRING IMPOSSIBLE.

As is well known, many persons have en seriously injured from "back-firing," the too early ignition of the charge. e described action of this U. H. magneto

A difference of 30 degrees in spark ti is made by swinging the arm which c trols the action of the primary current terrupter.

All the rotating elements of the U. magneto are on F. S. annular ball bearin with lubrication provisions where e needed.

The self-start, the interrupter and individually detachable, so as to give rea distributor are all separately capt a access wherever desirable. The weight a dimensions are about the same as for other well-known magnetos.

ADVANTAGES.

This is the only magneto which is eff tive at all speeds of the hand-crank, a the only one with which premature ig tion is impossible. Besides these hig important unique features, the U. H. m neto is built in the best possible mann is readily accessible everywhere, and wear is so slight that no renewals are pected.

Apple Indicating Snap Switches

Dayton Electrical Manufacturing Com-ny, Dayton, Ohio, have added to their e of ignition apparatus two indicating p switches, one, No. 404 S, is for use ere both dynamo and storage battery employed in the ignition system of tomobiles and the battery used for rting. The other is known as No. 405 and is for use where the dynamo is used

Apple 404 S Switch.

charge the battery. Both of these tches have the same general appear-e and construction, but have different nections on account of their different poses.

he No. 404 S has four indications, viz.:

charge the battery while the engine ignited by the battery current. This swit can also be used where dry cells are e ployed for starting, but of course, "charge" position is not then employed

No. 405 S also has four indicatio "Off," "Battery," "Off," and "Charge." the first of these all connections broken; on the second the battery only connected; on the third the connections again broken, and on the fourth the dy mo is charging the battery, the curre being taken from the battery to ignite engine. No. 404 S is recommended touch spark ignition systems, and No. 4 S for jump spark work. The price of ea switch is the same, $2.

Besnard-Solar Lamps

Badger Brass Mfg. Co., Kenosha, Wi lately secured the sole right to manufa ture acetylene lamps under the Besna patents which cover a new system of lig reflection. In the Besnard lamps lo distance rays are projected strongly ahe by means of the new type of reflector use and short rays are diffused immediate in front of the car. In the foreign ty of this lamp a metallic reflector is use but the Badger Company used a Mang Mirror Co.'s reflector which is made Bausch & Lomb. This special short foc Mangin mirror, the makers state, has focus shorter than the Navy standard, a is especially strong. A special method

which is a plano convex or lenticular form, by which the rays are focused and refracted in long parallel rays as illustrated in the diagrams. The combination of the hyperbolic curve of the reflector and the lenticular form of the lens, a lens of large diameter can be used on a small lamp for to produce the same effect without this combination would require, it is claimed, a lamp three times as long.

AUTOMOBILE TRADE JOURNAL

Fig. 1. Front view sketch of the Besnard Lamp to show the "Eclipsing" mechanism; A is a black disc connected to a lever B, which is in turn connected to the shaft C upon one end of which is fastened arm D. Arm D has two extensions, one of which is connected with a wire E, the other, F, connects with the lamp on opposite side.

The short distance rays are those produced in front of the flame and thrown directly on the lens. These rays, magnified and rendered much clearer by the lens, diffuse naturally at the sides of the vehicle as illustrated by Fig. 3.

To eclipse the long distance rays the lamp is provided with a black disk or shutter (A, Fig. 1) which can be dropt between the flame and the reflector instantly by means of the lever (B), shaft (C)

Fig. 2. Diagram illustrating the effect of the Besnard system of light reflection. The effect of the Besnard system is the same as would ordinarily be obtained with a flame back at A.

and arm (D), which are actuated by a Bowden wire (E) from any convenient point. Where two of these lamps are used the disks of both can be dropt instantly, an extension (F) of the arm (D) being provided for interconnecting the two.

Two styles of these lamps are offered, one called the "Autoclipse" and the other the "Solar clipse," each being furnished in two sizes 9 and 10½-inch diameter lens, and either with or without the disk or shutter. Prices range from $45 for the 9-inch "Autoclipse" without shutter, to $70 for the 10½-inch "Solarclipse" with shutter. The Bowden for operating the shutter lists at $10.

The "Solar" line of lamps are improved for 1908, and new designs are offered. One of the most notable improvements is in the method of putting the Solar lamps together. They are assembled without

Fig. 3. Diagram illustrating how the short distance rays are diffused by the Besnard lamps.

solder and are held together by interior screws, leaving the exterior surface perfectly smooth. Should a lens mirror be broken, it can be removed and replaced without sending the lamp to the factory.

Another feature of the 1908 Solar line is a new black finish which is given some of the lamps, these black finish lamps having been brought out to fill the demand for lamps that do not require the attention and care that highly polished brass lamps need. The process used causes this black finish to penetrate the pores of the metal and actually become integral with it, and the effect is very rich.

The 1908 Solar Lens Mirror Headlight is made in several sizes, ranging in price from $10 for Model 856, to $28.50 for Model 859. The former is 6⅞-inch in diameter, and the latter 10⅛-inch.

The annual meeting of the Diamond Rubber Company resulted in the re-election of the old board of directors and officers.

The R. M. Owen Company was recently advised by James L. Farmer, secretary of the Jury of Awards of the Jamestown Exposition, that a gold medal had been awarded the Reo No. 33 for the 500-mile non-stop dash which it made from New York to Jamestown immediately after finishing the 1907 Glidden tour with a perfect score.

Showing Midgley Universal Rim ready for Dunlop Tire

Showing Midgley Universal Rim ready for Clincher Tire

AT the recent New York Madison Square Garden Show why were 21½ per cent. or 42 of the 197 cars equipped with Midgley Universal Rims?

¶ Why were the most talked of cars at the same show not only equipped with Midgley Universal Rims marketed by the Hartford Rubber Works Co., but also fitted with Hartford Midgley Tread Tires made by the same company?

¶ We believe the best answer is found in the Rims and Tires themselves—in their ability to perform perfectly under every conceivable kind of test.

¶ We *know* that Hartford Tires—both plain and made with the famous Midgley Tread—are quality tires beyond question. They are made of the right materials—in the right way. Their long life and splendid service are only a matter of consequence.

¶ It will pay you to investigate further into the matter. Write us for the booklets "How to Drive without Skidding"—and "How to put on a Clincher Tire." And let us tell you all about the new Hartford Quick Detachable Clincher Tire which fits any make of detachable rim; or better still—see the nearest of our branches or agencies for a demonstration.

W. E. Synchronized Ignition System

A new electric ignition system has been brought out by the Western Electric Co., West and Bethune streets, New York City. Perhaps it will be more correct to say that a new combination of well known parts has been made. Essentially, the system consists in the use of a single vibrating coil with condenser, and an interrupter or distributor in the primary circuit, which distributes the current to a series of specially wound cylindical unit coils, one for each plug, these coils being arranged in a tube alongside of the engine cylinders so that a 6-inch secondary lead to each plug is sufficient. The individual coils are non-vibrating and without condensers, making an inexpensive construction. Absolute synchronism is the main feature claimed, and also the fact that there is no length of secondary wiring and no distributor in the secondary circuit. Leakage of the secondary current is practically eliminated, and these wires are connected by means of removable sockets, so that any wire can be instantly disconnected. The short wiring also reduces the cost of installation of the system. The unit coils are interchangeable, and, it is claimed, entirely water and oil proof, the installation being such that they are not in the least affected by the heat of the engine. A small box containing two vibrators and condensers equipt with a combination pole-changing and battery switch, which allows of the use of either vibrator, one being held in reverse, is arranged on the dash board of the car. This switch, as implied by its name, each time it is turned on or off reverses the direction of the current, thus doing away with harmful pitting, and it is claimed causing the vibrator contacts to wear perfectly smooth, so that they do not require filing or further adjustment after once being properly set. Only one low tension wire leads thru the dash to the common terminal of the tubular spark coils.

Altho but one vibrator is used in ordinary running, the second is used as a reserve, and may also be set somewhat heavier while the regular one for running is set very fine. In starting, the heavy spark may be used, and the switch then thrown over from the seat, thus running on as minimum an amount of current as possible, it being claimed under test this system works perfectly with from .2 to .3 ampere. In case of too much oil, improper mixture, etc., the heavier spark can be used with beneficial results until conditions in the engine are rectified.

The pole-changing switch is operated by a special key which can only be removed in the off position, thus forming a means of locking the car. A second lever protrdues downward from the same switch and operates the battery switch. It is so designed that it will connect either of the sets of batteries to the system if batteries are used, or will connect with any other source of current, but has no "off" position, and it cannot be used for starting or stopping the car, thus making the use of the pole-changing switch compulsory.

In the accompanying diagram is shown the wiring system, the upper half representing the vibrator and dash board coil, and the lower half a 6-cylinder engine and the series of unit coils, which are arranged in an enclosed tube, very little larger than the usual tube for carrying the high tension wires to the different cylinders in the ordinary systems of ignition.

Fig. 1. Wiring diagram of Western Electric Synchronized Ignition System with one vibrator and a system of multiple unit coils. The distributor is in the low tension circuit as shown at the bottom of the diagram and a special switch as shown at A, is so arranged that each time it is used it reverses the polarity.

SPECIAL FEATURES.

There are several features in connection with the coils used. No insulating silk is wound upon the No. 34 gage copper wire of which their windings are composed, its place being taken by a new baked enamel insulation, a special product of the Western Electric Co. This insulating material is much less bulky for the same insulating effect than silk, thus permitting of the use of larger sized wire in the same winding space, or in other words, the same number of turns of large wire can be used without making the coil more bulky than those wound with smaller wire, but with the more bulky insulating material. This, of course, means a les-

them rigidly in position and in defi- relation to each other, and of course makes them water proof. A layer of ially prepared insulating paper is also ed between each layer of the enameled , making it impossible, it is claimed, reak down the coils by the ordinary ges used in the operation of motor Each condenser is tested with 500 a. c., which is an absolute guarantee nst breakdowns from ordinary volt-

THE VIBRATORS.

e vibrators are also somewhat dif- nt from those generally used. Instead thin spring, the vibrator blade is at one-eighth of an inch in thickness, ed to a knife edge at one end, this resting in a V-shaped groove, the e of course being in a horizontal po- n, and held by a small helical spring. blade is within 1-64th of an inch of

g. 2. The Western Electric Vibrator, show- the heavy blade in place of a thin spring, the method of retaining the adjusting screw ny position as explained in the text.

end of the core, and it is claimed al- t instantly ceases to vibrate except at proper times, being held normally nst the upper contact. It thus always ts from the same position, thus in- sing the accuracy of spark time. A neat arrangement, consisting of a ll spring-piece thru which the vibra- screw passes, puts an upward tension this screw, causing sufficient binds in threads, so that the screw will remain nanently in any position or setting, not jar loose.

he equipment of this system is small neat in appearance, and the installa- is comparatively simple. All the ad- tages of a single spark coil, high ten- , distributor system, without any of disadvantages are claimed, it being ed that the system is as simple to ntain as a single vibrator spark coil on ingle cylinder engine.

The "Monarch" Self-Starting Device

he Monarch self-starting device for au-

one of which is an inlet poppet valve on a stem, which carries a collar, and is held up by a spring acting agains the collar. These valves being open, ai is drawn into the cylinder. Each cylinde has also an outlet valve, with guide ex tension.

The "Monarch" Self-Starting Device.

The three cranks on the crank shaft ar set 120 degrees apart, so that there ca not be a dead set. The crank shaft ha a small pinion at one end, and a sprocke wheel at the other, and it engages th crank shaft of the automobile engine b a chain. The air motor is geared two t one of the engine, thereby not diminishin to any considerable degree the powe from the engine. The engine being i operation and engaging the air moto air is pumped and stored in a small hig pressure tank, and when the desired pre sure is obtain the air motor automaticall stops. The pressure tank is tested to 80 pounds hydraulic pressure, but can b filled and adjusted to any require amount of pressure for each individu engine. The pressure can be stored i the tank indefinitely.

The main engine having stopt, if it desired to start it, the operator by mea of a lever releases air from the pressu tank, thru a pipe, to the cylinders of th air motor, and the power is communicate to the automobile engine, thereby aut matically starting the motor.

Unless the pressure in the air tank ha dropt sufficiently, nothing further will e sue in the operation of the starting devic but if at any time while the engine running, whether by use of the air in th tank, or leakage therefrom, the air pre sure falls below a certain point, this w cause the engine to drive the air mot as an air compressor and to re-charge th tank. In all this time, the valves op

but have a portion of their circumference removed so that they are in reality yokes. Each of these is provided with a lug which fits into a notch in the inner surface of the outer casing, as shown in Fig. 2, at X, so that the bands M and N must of necessity turn with the outer housing, and at two other places they are prevented from spreading or separating too far by the pieces, O, O, one of which is shown in side view at O in Fig. 3. The grip of these bands on the rings K and L is greater than the frictional resistance of K and L in the worm threads, so that if the bands M and N are turned, K and L will turn with them and move either inward or outward on the threaded nuts, H and J. There is sufficient space between K and L so that K could be moved on its thread to the left sufficiently to disengage from C, in which case it would abutt against the ring L, but could not engage the surface B. With these facts in view the action of the device is as follows: When the motor rotates the housing, the rings M and N rotate with it, carrying with them the hardened rings K and L, and as each of these are right hand threaded they move into the positions shown in Fig. 3, engaging the coned surfaces D and C. This action is almost instantaneous, as the distance is so very slight. As the exterior of K and L are extremely hard and the surface serrated or grooved to allow the oil and air to escape, these two members are immediately gript by the coned surfaces C and D, and rotated, but it will be seen that as soon as they are rotated as they cannot screw further on to the threads the nuts H and J are rotated with them, and therefore the shafts F and G leading to the rear wheels are also rotated. The greater the resistance to turning, the more strongly K and L are forced by the threads into engagement with their coned surfaces C and D, so that they cannot slip. The whole mechanism now rotates as one piece. If one wheel, for instance that connected to shaft F, tends to overrun the other, as when making a turn, the nut H, turning with it faster than the outside casing is driving it, immediately screws the ring K toward the left, releasing it almost instantly from the surface C, and as before stated it cannot engage surface B as it comes against the other ring L which is still driving, thus

AUTOMOBILE TRADE JOURNAL

that it suits any car regardless of how the muffler is to be located. The spring is oil tempered and very durable. This muffler has four expansion chambers. The inner and outer drums are made double and interlined with asbestos. The outlets are so arranged that the exhaust gases form their own cushion, and no baffle plates or tortuous passages are found necessary. The outer drum is covered with Wellsville polished or aluminum coated steel as desired. Prices run from $5.50 to $7.50 without the cut-out, and from $6.50 to $8.50 with the cut-out. The diameter of the muffler is in all cases 7¼ inches, and the lengths are 14, 20, 24 and 32 inch in the standard size, altho special sizes with special fitings can be furnished on order.

Climax Special Automobile Machine Work

The Climax Machinery Co., Indianapolis, Ind., is making a specialty of clutch disks stampt from high carbon bright stock, and then straightened. The concern believes this method to be better than to grind the disk, as the hard surface is left intact and presents better wearing qualities. They also do a large amount of contract machine work, making such parts as selective and progressive levers, starting cranks, connecting rods and all kinds of large and small automobile parts, excepting cylinders and pistons. Another specialty of theirs is a cast iron crank case covered with sheet steel, riveted in position and then galvanized, thus making a complete oil tight case with no danger of leakage.

The "E. C. B." Carburetor

The E. C. B. is a double spray nozzle, springless, compensating, float feed carburetor, and is manufactured by the E. Broderick Manufacturing Co., Detroit, Mich. One of the features of this carburetor is that it throttles the inlet air ports rather than the outlet to the engine. There are 3 air inlets, 2 in the vacuum chamber or upper portion of the carburetor, and 1 in the lower portion or gasoline chamber. The two upper ports may be operated together or separately. One of these ports is intended to be piped to the exhaust. These ports can be arranged so as to take all hot air or all cold air or more of one than the other to suit the requirements of the car in any weather or climate.

The gasoline nozzle supply hole is above the bottom, as is shown in accompanying cuts, thus grading the gasoline supplying the lightest and most volatile to the spraying point. The level of gasoline when set always remains the same, and is always visible, being shown by graduations on the glass. The level of the gasoline can be adjusted with engine running or at rest by loosening the lock nut that holds the inlet needle stay or guide. By raising the guide till it is out of the slot and turning to left or right, the gasoline level can

Sectional Elevation of the "E. C. B." Carburetor.

be raised or lowered as desired, after which the guide is again dropt into the slot and the guide nut tightened, thereby holding it firmly in place.

A valuable feature of this carburetor is the auxiliary spray starting nozzle which at the top is cup-shaped, and which fills up with gasoline the moment the engine stops, thereby always making it ready for starting again. The hole is so small as only to keep the engine alive while running idle. The main nozzle and air ports are opened with one movement, and the engine gets a graduated amount of air and gasoline, making a positive and flexible control. A raised gasoline inlet needle seat is inserted for two purposes; first, to trap the water, heavy gasoline and dirt, and second, should the seat be marred or destroyed from any cause the carburetor need not be thrown away. This inserted seat is slotted and can be taken out with a screw driver and another put

Plan Sectional View of the "E. C. B." Carburetor.

in. The operating of the inlet needle valve is in full view, which is a decided advantage. The screen shown is a factor of safety in event of a back fire, and has such an area as not to impede or choke the engine in the slightest, while it is somewhat beneficial in further aiding in mixing the gas.

To start the engine any time, especially in cold weather, auxiliary air ports are closed. Both ports in the vacuum or mixing chamber being closed, the air is drawn up thru the central conical air passage, which is contracted to the greatest degree in the immediate vicinity of both nozzles. It draws the gasoline out of the cup-shaped nozzle, thereby starting easily. This carburetor does not need priming.

The Croselmire & Acker Co., 42 Walnut street, Newark, N. J., are producing a line of platinum and platinum-iridium rivets for spark coil construction made from solid bars of platinum. These rivets are made to size down to the thousandth part of an inch, and can be furnished in any size or quantity that the trade might require.

The Midgley universal rim, the 1908 model of which was described and illustrated in our November number, page 192, is marketed not only by Hartford Rubber Works Co., but by Morgan & Wright, Detroit, Mich., and the G & J Tire Co., Indianapolis, Ind., as well, all three concerns holding manufacturing licenses under the patents on this rim.

The "Marvel" Carburetor

A new carburetor has lately been placed on the market by Marvel Carburetor Manufacturing Co., Lock Box 41, Indianapolis, Ind., called the "Marvel." The figured sectional illustrations herewith and their explanatory captions make clear the arrangement of the various essential parts, and the following descriptive data covers the special features of the device.

The body of the carburetor is made of high grade red brass, and the gasoline needle and float valve bearings are made of the finest rolled Tobin bronze. Special attention is called to the bowl (15) in Fig. 1 and the lock nut (22) under the bowl, which permits the gasoline connection (by loosening the lock nut (22) and swinging bowl (15) being turned to any position where the connection can be most conveniently made. By removing the lock nut (22), the bowl can be removed from the lid, and any adjustment in the float or float valve, or any residue removed from the bowl, without changing the adjustment of the carburetor in any way or without disconnecting it from the engine. The carburetor is constructed so that all internal disturbances, such as flooding and bounding are prevented. The float needle is fitted with an equalizing spring, which allows of a floating balance and an ease of movement which prevents all jar resulting from the restlessness of the float. The

Fig. 1. The Marvel Carburetor. 1, Gasoline Nozzle; 2, Needle Lock Nut; 3, Packing Nut; 4, Adjusting Needle; 5, Float; 6, Air Valve Spindle; 7, Air Valve; 8, Air Valve Lever; 9, Air Valve Spring; 10, Air Valve Adjusting Screw Lock Nut; 11, Intake Connection Lock Nut; 12, Air Valve Adjusting Screw; 13, Intake Connection Stud; 14, Intake Connection; 15, Bowl; 16, Gasoline Union Lock Nut.

removal of the cap (20) allows the adjustment of the float valve. By removing the bowl and loosening one adjusting screw, the entire float valve, needle and all, can be removed with ease and thoroly cleaned and replaced by the most inexperienced.

Particular attention is called to the direct central location of the gasoline spraying needle (4) and the nozzle (1); also to needle lock nut (2) and packing nut (3), forming two distinct guide bearings whereby the needle is held perfectly central in guide nozzle (1). Located closely beside the nozzle (1), Fig. 1, will be seen overflow pipe (31) with two arrows, one entering and one leaving the bottom of the pipe, the object being to prevent in any case the flooding of the tube leading to the engine. Located centrally in the engine connecting tube, and directly over the spraying nozzle (1) will be seen a butterfly automatic valve whose function is the mixing and controlling of the gasoline and air at all engine speeds. Referring to this valve in Fig. 2 it will be observed that an oval shaped expand-

Fig. 2. The Marvel Carburetor. 17, Gasoline Union; 18, Gasoline Supply Needle; 19, Equalizing Spring for Supply Needle; 20, Cap for Gasoline Supply Valve; 21, Float Lever; 22, Bowl Lock Nut; 24, Throttle Spindle; 25, Throttle Valve; 26, Throttle Lever; 27, Hot Air Adjusting Elbow; 28, Hot Air Pipe; 29, Float Lever Attaching Screw; 30, Hot Air Pipe Attaching Screw; 31, Overflow Pipe; 32, Adjusting Screw for Hot Air Elbow.

ing diaphragm is used. The expansive movement of this diaphragm will be seen in Fig. 1, on dotted lines (7). When this valve stands in the vertical position at rest (7), solid lines will indicate the low throttle of the carburetion. At this point the mixture must be regulated by the gasoline supply needle (4), by slightly closing or opening it.

The careburetor can be connected to the engine by releasing two nuts (11), Fig. 2, from studs (13) in Figs. 1 and 2, and simply turning the connection around will permit of either horizontal or vertical connection. Another feature of this carburetor is the hot air pipe connection, which by releasing the screw (30) in Fig. 1 allows it to be turned in either direction to suit the throttle connection. The carburetor is made in ¾-inch, 1 inch, 1¼ inch and 1½ inch sizes, listing at $11.00, $12.00, $13.50 and $15.00.

The directory of automobile, motor boat, motorcycle, part and accessory manufacturers, which constitutes the most important feature of the January Journal, is the most accurate of its kind, and from no other source can you obtain one so complete. Subscribers to the Journal are sure to obtain a copy, as no extra charge is made for this important number. Non-subscribers should, however, remit at once if they desire to have their subscriptions commence with the January number. The yearly subscription rate is $2.00. Single copies of the January number can be had at 20 cents each, same as any other number.

The "Breech-Block" Plug

is the "cold weather" plug. If you keep your car in "cold storage" in winter, don't crank off your arm starting up in the morning—simply open each breech and squirt in a few drops of the "essence" which settles round the points where the sparks are and she's off with a quarter turn 1000 times out of 1000.

When you come from a run, pick out each breech and pour in a spoonful of kerosene while the engine is hot, then give her a couple of turns. The next time you start, she is free. She will dance on the charge and start off running smoothly and sweetly.

The chambered end of the plug brings the spark deep down in the mixture. The engine runs smoothly on mixtures throttled down to the limit—mixtures that put the open end plugs out of business.

The chambered nipple costs twice as much to make as the open. Its merits are easily proven. The open end kind can be furnished however to the non-thinking user.

All breeches interchange perfectly. A questionable plug can be instantly removed without stopping the engine, and a tested one put in its place.

The Breech Block Terminal Clip is now furnished with a patented handle. It can be detached from the plug in an instant while the engine is running without getting a shock, the kind of a spark that is reaching each plug may be noted and the trembler adjusted if needed. It's a heap of satisfaction to be able to locate your spark trouble instantly.

Every kind and shape of porcelain has been tried on the "Breech Block." We think those we are using are the best glazed and toughest made, but any kind or shape can be furnished in reasonable quantities.

The "Breech Block" is the plug of the future—"four can be removed, cleaned and replaced in less than a minute."

Write for booklet.

THE STANDARD COMPANY,

1908 Conover Wind Shield

The Conover Wind Shield Company, of Paterson, N. J., has made an important improvement in the Conover Wind Shield for 1908. This improvement consists of a new method of holding the glass in the frame in such a manner that rattling is entirely avoided. The inner side of the tubular frame is slotted to admit a grooved piece which by spring action holds the glass, the edge of which is backed up by a piece of felt packing. As the glass is continually gript by this grooved piece it cannot rattle, as there is no side play whatever. This method also has the advantage of flexibility, and the frame can be twisted considerably without cracking the glass.

Another important feature of the Conover Wind Shield is the adjustable side rod which is now used. This makes the shield applicable to any car without any cutting or soldering, which are necessary where non-adjustable side rods or braces are used.

End sectional view of the frame of the 1908 Conover Wind Shield.

In the acompanying illustration A represents the special brass tubing used for the frame of the wind shield, B the spring anti-rattle device, C the felt strip which entirely surrounds the outside edges of both the upper and lower glass D. The spring B entirely surrounds and also presses gently on both sides of the glass, thus entirely eliminates all possibility of rattling. The spring being made of phosphor bronze will last indefinitely. By removing two small screws, either glass can be taken out or put in, in less than one minute, by any one without special skill.

The "Wico" Spark Plug

The Wico Spark Plug is the product of the Witherbee Igniter Co., 541 West Forty-third street, New York City, manufacturer of the well known Witherbee battery.

A feature of this plug is that it possesses a micrometer attachment which permits of quick adjustment to any required distance down to 1000th of an inch. By means of this feature accurate adjustment of the spark gap is permissible and all guess work obviated.

The porcelain is made to withstand the most intense heat without breaking or cracking, and the end of the electrodes are so formed that they act as a siphon cleaner, at the same time providing a large sparking surface. In case the plug

The "Wico" Spark Plug, Sectional View; A, the packing gland; B, main carrier for the porcelain; C, lock nut for porcelain carrier B; D, the main shell into which the porcelain carrier B screws.

fouls, all that is necessary to remedy the trouble is to take out the brass porcelain carrier and wipe off the end, screw it back to where it was, and the adjustment remains the same.

To adjust the plug the nut C is loosened and the porcelain carrier B raised or lowered. By observing its location and turning from a given point 1-6 turn either way, gives 1000th of an inch adjustment to the gap. When in proper position the nut C is locked.

To remove the plug for cleaning, the nut C is loosened and the porcelain carrier B is raised or lowered, the porcelain wiped off and replaced to its original position.

A complete directory of the entire manufacturing element of the cycle, automobile, motor boat and parts and accessory trade will, as usual, be included in our January number, and no extra charge will be made for this valuable feature, altho the directory once sold at $1.00, bound separately. Non-subscribers should subscribe for the Journal at once—yearly subscription, $2.00—to assure receipt of the January number. Single copies can be obtained at 20 cents, same as other numbers.

ruction being such as to eliminate all cate mechanism, thereby reducing its ing parts to the least number of pieces ble.

is of the governor type constructed entirely different lines from any- yet attempted. The device is ated by a train of gearing from the

"Standard" Speedometer-Odometer, Model

rnor weights direct to the indicating . The governor weights are attached wo pivoted gears which revolve to- er with the main spindle and mesh a circular rack which is moved length- on a central spindle. This part com- s the entire revolving mechanism and ounted on a hardened steel ball bear- The rest of the mechanism is sta- ry with a gear always in mesh with revolving circular rack. These gears ll very accurately made and of hard- steel running into bronze. The er itself is attached to the top end spindle with a very long bearing, h is operated by this upper train of onary gears. The dial is evenly ed and the governor weights move tly in proportion to the hand at all ls. The only spring used in this in- nent are the two coil springs one on side of the governor. It can be at- ed to either the right or the left hand l and also will indicate the speed and the mileage that the car has been n backwards instead of subtracting it. e Standard speedometers are all fitted a special pivot drive. This elimin- the bend in the shaft at the wheel, enables the shaft to be carried straight to the dash. The well known Veeder meter is used. This gives the trip total mileage, the trip being set back

out the maximum hand $50.00. This typ is also made with an 80 mile dial and lists $65.00 with maximum hand, and $60.00 without.

The Standard steering knuckle clamp is as near universal as it is possible to make it, and will fit nearly, if not quite all of the different types of steering knuckles now in use on the various makes of cars. When once properly attached it will remain in place indefinitely.

Interior Construction of the "Loring" Speed Gage

As a supplement to the description of the 1908 "Loring" speed gage that appeared in the November Journal, page 205, we present herewith an illustration of the interior construction of this device, which is marketed by the Loring Auto Appliance Co., 49 West Sixty-third street, New York City, a cut of this view not having been available heretofore.

By reference to this illustration it will be seen that the Loring instrument operates on the flyball governor principle, cen

Interior construction of the "Loring" Speed Gage

trifugal force being relied upon to actuate the mechanism. As perfect balance of the rotating parts is necessary to obtain accuracy, the weighted arms are balanced against the effects of gravity or any influence except that of centrifugal force, and the makers of the instrument claim absolute steadiness for all positions of the indicator needles.

The "Pater-Noster" shock absorber which is marketed by Herz & Co., 203 Lafayette street, New York, has been im

Hosted by Google

IGH TENSION
AGNETOS

When a manufacturer equips with Eisemann-Lavalette Magnetos it means that he considers his cars equal in class to the highest grade foreign cars, although there may be a wide difference in price.

The greatest cars of Europe use Eisemann-Lavalette Magnetos exclusively. The Peerless, Packard and other leading American cars equip their entire output with our magnetos and freely admit that it is in a great measure due to the perfection of our instrument that the running qualities of their cars have brought them to their present remarkable popularity.

Magnetos are as permanent an integral part of the motor car construction to-day as pneumatic tires.

The question then is—which magneto?

The answer is—the Eisemann-Lavalette.

The Eisemann-Lavalette, in spite of its admitted superiority, costs, with dual ignition, $50 less to install than any competing make, because of its mechanical points of extreme simplicity, which cannot be duplicated without infringing our patents.

It does away with the cumbersome necessity of placing a timer on the motor with all its attendant wiring complications and expenses. It gives a greater increase in efficiency than any other magneto on the market. It is the most durable instrument of this sort, and it will outwear any car on which it is installed. It is perfect in the matter of timing. This means that it lengthens the life of the motor to a remarkable degree, gives perfection of service under all conditions, which can be obtained in no other way, and is as much a factor in strengthening the performance, and, consequently the reputation of the car as any other one point in its construction.

If you make a moderate price car, say $2,000 or $2,500, the use of our magneto will at once class it as a leader at that price. It will enable your agents to give demonstrations fully equal to a $4,000 or $5,000 car, provided the difference in horse power is not too great. It will mean an enormously increased demand for your cars in 1909, with no effort to yourself, and it will also mean that the best automobile agents will be more apt to solicit making connections with you on your own terms. They know the value of any instrument and we are taking strong steps to see that they do not forget it.

The Eisemann-Lavalette Magneto carries its coil in a separate box, thus providing ample space for a heavy thickness of insulation. The space is so ample that we would increase this insulation provided there was any advantage to be gained by it. Barring accidents, it is impossible for short-circuiting to occur. In the very rare cases where short-circuiting has occurred it has been a matter of slight expense and a few minutes of time to install a new coil in this separate box, thus making the instrument absolutely as good as new. When short-circuiting occurs in this separate box, which is a safe distance from the armature, the magneto is entirely unaffected.

In competing makes, which claim to be as good as the Eisemann-Lavalette, the coil is carried in the space inside the armature. This space is so small that the insulation is, of necessity, very thin and inadequate. With inadequate insulation short-circuiting is bound to occur sooner or later, and when it does occur the entire magneto is out of commission and must be replaced by a new instrument or sent to the factory for repairs.

When you sell a man a car equipped with an Eisemann-Lavalette Magneto you can guarantee him freedom from Ignition troubles. Our guarantee to you stands behind yours. By using our instrument you greatly reduce his cost of upkeep.

Are you dissatisfied with your present ignition system? We have engineers, specialists in WHAT YOU WANT TO KNOW. We will gladly send one to you to work out your ignition problem for you. Better still, come and see us at the automobile shows. We are exhibiting at all of them.

LENS MIRROR SEARCHLIGHT

SQUARE OR STRAIGHT LINE EFFECT TO MATCH OIL SIDE LAMPS

Ever since the coming vogue of the square oil side lamp, our designers have been trying to produce a headlight that would match the business-like and artistic lines of the square line oil lamp.

A square headlight was out of the question. We have therefore designed a square line headlight (as looked at from the side, the point from which a car is generally seen.)

Particular attention is called to the square corners made up from straight lines, the ventilating holes in the hood are square also; socket of lamp is square, in fact everything is in harmony, and if you have square side oil lamps, you should have our 1908 headlight and then your lamp equipment will be in perfect harmony and up to date in every particular.

Trade Printed Matter

The Goodyear Tire and Rubber Company, of Akron, O., lately issued a folder calling particular attention to the fact that only one spreader is needed on Goodyear Universal Rims. This folder is gotten up in an attractive form, and contains an illustration showing the one spreader that is needed, together with a strong paragraph of advertising matter.

The American Motor League have lately issued a map of the route between Philadelphia and Pittsburg, via Downingtown, Coatesville, Lancaster, York, Gettysburg, Chambersburg, McConnelsburg, Everett, Stoystown, Jennertown, Ligonier, Greensberg, Irwin, and intermediate points, and will give 5,000 copies to members of the League, the prices to outsiders being 50 cents each. The maps are drawn and arranged from actual surveys, and information supplied by members of the League who have covered the route.

The Vehicle Apron and Hood Company, 272 North Fourth street, Columbus, Ohio, have just issued their 1908 catalogue, containing 32 pages, which shows that they have greatly extended their line of products for the coming season, and now include in addition to their tops, storm aprons, top boots, etc., a line or weather proof clothing for automobilists, leggings, sleeve protectors and similar fabric specialties.

The Studebaker Automobile Company, of South Bend, Ind., have just published one of their route books containing data of the route from Chicago to South Bend and South Bend to Chicago, wisely giving the reverse of the route separately so that a tourist can easily follow the same without deep study and mental rearrangement of directions. There are several pages of map-diagrams for the guidance of the user in connection with the detailed information given on the other pages. The cover of the book is a durable cloth suitable for the purpose.

The 1908 Warner Auto-Meter, made by the Warner Instrument Company, of Beloit, Wis., is very cleverly described and attractively illustrated in the latest catalog of this concern. The catalog is gotten up in good style and consists of 32 magazine-size pages enclosed in an attractive embossed cover on which appears in gold an illustration of the "Auto-Meter" itself. The catalog not only describes the constructional features of the instrument, but tells about the methods of its manufacture, and goes into such detail that the reader cannot help but fully grasp the good features of this well known instrument. The last few pages of the book are devoted to a number of strong testimonials from users of the Auto-Meter.

The H. H. Franklin Mfg. Co., have been sending out pithy little booklets from time to time calling particular attention to special features of the Franklin air cooled cars and the latest in this line is a 14-page booklet in a buff cover containing the title "A Trifle Technical But—" This booklet contains very terse paragraphs describing the Franklin Auxiliary Exhaust, Concentric Valves and other important features of the 1908 Franklin cars.

A new catalog describing the 1908 Truffault-Hartford Shock Absorber has just been issued by the Hartford Suspension Co., 67 Vestry St., New York, and contains 24 pages enclosed in a very attractive cover showing a car equipt with a Truffault-Hartford Shock Absorber traveling over an extremely rocky road but carrying passengers who show by the pleased expressions on their faces that the jolts and shocks are all absorbed, making the ride very smooth. The illustrations of the device itself and of the road scenes which are spread thru its pages are all clear and leave a good impression on the readers' mind, while the reading matter is complete and well prepared.

An 18-page, well printed and well designed booklet has been issued by Kilgore Mfg. Co., Old Town, Maine, to advertise the latest model of the Kilgore shock eliminator. The cover illustration includes their advertising phrase "Ride On Air" and a very suitable illustration of the same. A number of half tones and diagrams are used to illustrate the text.

The good work of the "Reo" in the Glidden Tour is detailed in a booklet of 20 pages and cover carrying the title "The Giant of the Glidden Tour," which has recently been isued by the general sales agents of the car, R. W. Owen & Co., Lansing, Mich.

Williams & Robinson, Limited, Ferry Works, Queen's Ferry, S. O., Flintshire, England, makers of vanadium steel, have recently gotten out a very comprehensive and business like pamphlet which is being distributed by G. F. Ehrenzeller, Sole Agent for these steels in the United States, with offices in the Pennsylvania Building, Philadelphia.

In this pamphlet the qualities of vanadium steel are set forth in detail with the reasons for its fitness for use in the manufacture of automobile parts, as well as for tramway and railway work, illustrations of the micro-structure of some types of the steel are given, and motor car parts are shown in all stages from the billet to the finished article. The results of tests are also given and form interesting reading for the automobile manufacturer. The Company also manufactures carbon steels of high quality, including tube steel for the manufacture of high grade solid-drawn tubes, which it is claimed is in every respect fully equal to the best grade of Swedish Mild Steel. The Company will be glad to supply any further information concerning the steels manufactured beyond what is contained in this small but comprehensive pamphlet.

The Phoenix Auto Supply Co., St. Louis, Mo., of which A. L. Dyke is president and general manager, lately published their No. 3 catalogue illustrating a large line of 1908 automobile material. The book contains 80 pages and cover, and also a tipt-in order sheet for the convenience of customers. Besides illustrations of various makes of automobile parts and accessories, the book contains some characteristic Dyke illustrations of an amusing nature.

The Bethlehem Steel Co., South Bethlehem, Pa., have issued a special booklet, relative to their special steels, drop forgings, and frames for automobile manufacturers. The illustrations include a view of their plant, a picture of one of their very large drop hammers, and various pictures of twisted steel products showing the toughness of their steel. As a very fine grade of paper is used, the illustrations and text matter all show up very clearly, and the whole book is calculated to leave a very favorable impression upon the reader, regarding the high quality, durability, and general suitableness of Bethlehem Steel in automobile use.

The Maxwell-Briscoe Motor Co., Tarrytown, N. Y., have started the publication of a little house organ entitled, "The Co-Operator." The aim of this publication as outlined by Mr. Benjamin Briscoe in the first number is to "bring together into closer communion all those of the Maxwell faith to the end that they may understand each other better, that they work together with the utmost enthusiasm, and strive with greater energy toward the object of placing the Maxwell automobile on the very top round of the ladder of success." A careful perusal of the paper leads one to believe that it will be successful in obtaining this object.

The White Co., of Cleveland, O., distributed at Madison Square Garden Show copies of their latest White route book, the fifth in the series issued by this company. This book gives detailed route directions for over 1500 miles of the main highways suitable for tourists in New York State and in the Province of Quebec, including the routes in both directions between New York and Albany, and between Albany and Buffalo. Like the four others in the series, this White route book is profusely illustrated and contains a double page map of the section of the country covered, as well as descriptive matter relative to the routes.

One of the most elegant catalogs issued this season is that of the Baker Motor Vehicle Co., of Cleveland, Ohio, manufacturers of the well-known Baker Electrics. It is elegant because of its high character and simplicity. It is not what might be termed an elaborate catalog, because there is no ostentatious display of costliness. It is pocket size, being 7½ inches long and 4 inches wide, and the illustrations are clear and pleasing; the reading matter brief and convincing. The whole is in appearance attractive and effective. The Baker Motor Vehicle Co. are to be congratulated on having produced a commonsense kind of printed matter for illustrating and describing their goods. Anyone interested in electric vehicles should send for a copy of this catalog.

The Silent Northern 24.2 H. P. (A. L. A. M. rating) $1600

f. o. b. factory—includes full gas and oil lamp equipment.

For 1908 the Silent Northern embodies the same strong, enduring construction that has given it supremacy for five successive years, plus *MORE POWER,* due to large cylinders, larger valves and other refinements. Five years experience manufacturing this one type insures perfection in every detail.

¶ Style, efficiency, reliability, quietness the conspicuous features. As you are in search of these qualities any comparison you may make ***must*** confirm the fact that this is the greatest value the automobile world affords.

¶ Perfectly balanced motor — *the quietest, smoothest-operating,* simplest automobile engine made—supported at three points—the "Northern way." The mechanism cannot get out of alignment no matter how difficult the roads.

¶ Every part accessible and every part protected. Full control on steering column.

¶ Each detail of construction thoroughly tested out and successful. No guess work—no experiments. This car will prove for ***you*** as it has for others—a genuine money-saver—and give you every comfort and pleasure possible to get from any machine regardless of price. Investigate. Find out for yourself. Send for the Catalogue.

elevation in partial section is herewith shown. The cam-shaft is spur-gear driven from the crank-shaft, and the mechanical oiler, 6-leads, is driven by 45 degree angle gears from the cam-shaft, the oiler base serving as the crank-box cover. The

Fig. 3. Cartercar Connecting Rod. These rods are steel castings of V-section for the retention of oil and are 8 5-8 inches, center to center.

commutator is placed on the top end of the lubricator vertical driving-shaft. The connecting rod-bodies are V-section, to make them serve as oil-troughs to catch oil and lubricate the crank-wrist and the piston pin as shown in the accompanying drawing.

The valve action consists of rollers carried in pendulums. The roller-centers are placed above and below the cam axis with a view to quick opening and slow closing of the valves. The two roller pendulums are pulled towards each other by a single coiled spring, ends hooked in the pendulums, all as shown in Fig. 5. The valve pushers have fibre-filled cups, screw adjusted to make the contact silent. The cylinders are 5½x4½, and the crank-boxes and wrists are all 1⅞-inch diameter. The valves have chrome nickel steel heads with stems electrically welded to them. The ports are all 2⅛ inches diameter, valves 45 degrees angle. One of the arms of each crank is given a disk shape and this disk has an under-cut, annular groove formed in it to catch oil and transfer the oil to the crank-wrist oil-holes by centrifugal action.

CONTROL.

The spark and throttle control is had by ratchet-retained levers on top of the hand-wheel. The one outside hand-lever, not latched, traverses the paper wheel across the aluminum disk. There are two large pedals on the foot-board and a plunger pedal which opens the muffler. The left, large pedal pushes the disk to the rear and locks it to effect the disk and paper-wheel frictional engagement. The right, large pedal applies the rear-hub, internal, ordinary brakes only.

ON THE ROAD.

To show what the Cartercar fuel consumption is under ordinary conditions the following run was made, fuel measured.

October 17, 1907, a 1908, 5-passenger Model A Cartercar, carrying five passengers, total weight 3030 pounds, Mr. Snyder, driver, and Hugh Dolnar, observer, left Cadillac Square at 1.00 p. m., and was driven to Pontiac and return.

The day was delightfully warm, and the Pontiac road, gravel and clay, was good as it ever is, dry, not dusty and fairly smooth for much of the distance, with some rough spots and a detour at Birmingham, where the pike is closed for changes at the trolley power house. There was a fresh northwest wind, and it is a 450 feet climb to Pontiac, but as the course was doubled, wind and grade

eedometer and mile recorder and the ight was taken on scales, so the dis-

standing on a level floor. The highe speed noted was 37 miles per hour, a the distance, as shown by the record was 27.2 miles one way, 54.4 miles rou trip. The road surface altho rough spots, was hard, except over the deto in Birmingham. The speed limitations Birmingham and Detroit prevent fast ru ning, Detroit just now being severe fast driving.

Our running time, Hodges House to t Fountain, 27.2 miles, was 52 minutes. O weight was 3030 pounds, the distan covered was 54.4 miles; these figures giv 3030 multiplied by 54.4 and divided 6,000, 27.4 ton-miles to the gallon of gas line burned, a very much better resu than was had at the Cleveland trials ferred to, because the Cleveland runs we made on muddy roads, while the Ponti pike was clean and dry the day of our ru

There are not many cars made that c show as good as 27.44 ton-miles to the g lon of gasoline for this Detroit-Ponti round trip, and this run shows, conclusiv ly, that the Cartercar friction drive is n more wasteful of power than the ordina toothed-gear speed-change. This very joyable ride also showed the Cartercar be fast enough, and roomy enough to car five passengers with satisfaction to concerned.

Creditable Performances

Charles S. Henshaw, of Boston, Mass., October 17, made a noteworthy run of 1/8 miles with a Columbus Stanhope ctric, on only one charge of the bat- y. The run was over all kinds of high- ys from Boston to Gloucester and re- n. Mr. Henshaw started at 9.30 from State House, arriving in Gloucester ee hours later, a distance of 35 miles. the return trip the route was changed, l on reaching the garage the odometer istered 74.7 miles. Without five minutes t Mr. Henshaw continued over the city eets to roll up his mileage until the 1/8 miles mark was reached.

A Mitchell 20 H. P. motor truck loaded h one and a half tons of drugs, re- tly made a trip from Chicago to New rk City. The run was accomplished in hteen days. No attempt was made at king a time record. Six to eight hours lay were spent on the road and con- erable time was devoted to exhibiting truck in the various towns thru which past.

and violations of the automobile laws that state. It was organized in June, a recently rendered its first report, showi that it has been very active in the go work. More than 50 cases have been vestigated; five have been presented the criminal courts; four defendants we convicted, and one case was appeale Several other cases will soon be trie Eighteen complaints for reckless drivi have been made to the State Automob Commission, and about the same numb have been reported to the Commission, t evidence not being sufficient to warra a complaint and request for revocation licenses. The association has also pr pared cards for noting breaches of t law in the display of number plates, a issued these cards to the police of Bost and other cities and towns. Rewards ha in some instances been offered for t conviction of flagrant violators of the la The Secretary and Treasurer is Geor M. C. Sargent, 38 Equitable Trust Buildin Boston.

1908 Austin Model

6 Cylinder Austin, 90 H. P.

6 Cylinder Austin, 90 H. P.

The 1908 Austin Models are designed to exactly meet my own personal req ments after 6 years of building high grade cars, and to fulfill the ideas of that clas owners who want the "sportiest" kind of a car it is possible to get with *all* the po and speed they can possibly use—a car that is either a touring car or a runabout c ble of making a 1000 mile trip any time, and will beat anything on the road.

Our 6 cylinder 90 h. p. model is my idea of such a car—and I believe it st today without an equal in the Automobile world at any price.

Our new combination body as a touring car has an extra folding footb chauffeur's seat. The tonneau seat can be replaced in 3 minutes by a rumble thus converting the car into a runabout of the very latest design.

The equipment is complete in every respect, and includes both seats, and exte surrey top for the touring car, and single top for the runabout. We also furnish new combination body on our regular 60 h. p. model in place of 7 passenger to body. This regular standard body, either with or without detachable limousine will be furnished on both 60 and 90 h. p. models.

All Austin cars have the celebrated Austin Motor and are built in our own under my personal supervision.

Send for Catalogue and detailed information about our new models.

Fig. 3. Northern 1908 Model C, two-cylinder touring car. The details of the mechanism practically unchanged from last year. The large two-cylinder opposed engine is set cross- e of the hood and a shaft drive, the housing acting as a torsion arm, is used.

THE NORTHERN FACTORIES.

e Northern Company's Factory at oit is continued, now working about hands, with some $5000 value of ma- e tools in the way of gear-cutters and ling-machines added during 1907. The factory at Port Huron, 52 miles North etroit, ground broken in December, turned out its first completed car 1st, 1907, and is, at the time of this ng, October 16, 1907, working about hen. This factory is of brick, 2 stories, 65,000 square feet of cement floor- ce and $60,000 value of machine tool ment. It is the policy of the company ake all of the components of the cars own factories, axles included.

THE 1908 LINE.

e Northern 1908 7-passenger touring Model L has wheel-base of 119 inches, 56 inches. The tires are all 34x4½ s. The motor is 4-cylinder, 5x5 s, water-cooled, 4-cycle, dual-units, 40 A. L. A. M. rating. The change

under the hood in front, with a planetar gear, two forward speeds and a reverse placed in the crank-box rearward exten sion, with one universal joint to the beve gear and divided rear axle. The car weighs 2200 pounds. The price is $1600 including 5 lamps, mats, horn and tools all ready for extended touring. The cape top is $100 extra.

The Model C, two-cylinder 3-passenger runabout has the same chassis specifica- tions as the two-cylinder touring car. The motor is 24.2 H. P. by the N. A. A. M. formula. The weight is 1900 pounds, and the price $1600, including 5 lamps, mats, horn and tools, ready for the road. Upon this same chassis a limousine body is also fitted. This limousine body is of elegant design, finest upholstering and finish, beveled plate glass windows which will open, speaking tube, toilet and valuable cases and electric lighting from storage battery. This limousine body has ample

NOTABLE FEATURES.

The notable features of these Northern rs on the road are silence and the strong nning of the motors at low speed, due good balancing and low compression. e notable manufacturing feature is the nstruction of all principal components, the Northern Company's own factories. e silent action of the motor is obtained the placing of two large and long ffler-shells, having no internal obstruc-

of angle steel 2x3x¼ inches, wide me ber vertical inside, and narrow meml horizontal on top. The weight is greater than that of a prest steel fra which makers will guarantee to carry required weight, and the cost of the ang steel frame is only about one-half that the prest steel equivalent. The angle-st frame is much less damaged by accide than the U-section prest-steel frame, whi buckles under impact, while the ang steel frame merely bends under extre pressure and can nearly always straightened without replacement of frame sides.

The company claims never to have h a broken chassis frame, and offers to gi any man who can show a Northern chass

lowing the wheels to yield to obstacles. A single tubular rock-shaft journaled crosswise of the chassis frame, is made to support the rear end of the motor and gear box assembly the pedals and the steering gear, while this tubular shaft also serves as the brake-rocker.

BRAKES.

The brakes for both forms of chassis are on and in the same brake-drum, prest steel, 11 inches diameter by 4 inches face, instead of the much narrower faces commonly placed. This great brake-drum and shoe-width ensures durability, and enables the camel's hair brake facings to stand

1908 Northern Steering Column. The change speed lever is still under the hand wheel. The spark and throttle control are by concentric rocker and rocking sleeve with small knobbed levers under the wheel.

hard work without deterioration. It is stated by the company that it has never yet been necessary to replace the camel's hair facing of any brake-band or shoe on a Northern car, and some of these brakes have been in use for four years.

The 4-cylinder chassis uses exterior brake-bands and internal shoes; the 2-cylinder chassis fits exterior brake-bands only, the planetary reverse serving as an emergency brake. The rear hub brakes can slide the wheels.

Two-cylinder cars with tonneau and runabout bodies to carry 5 or 3 passengers respectively, are offered at lower prices than are asked for the Northern cars of the same seating capacity, and about the same power, while the appearance, when new, and the equipment list, on paper, are about alike for cars of the same class. The Northern prices are higher simply because it is claimed the cars cost more in the factory. In painting, which determines the appearance of the car, no less than eighteen finishing coats are given, while eight is the number of finishing coats actually applied to many low-priced automobile bodies. Instead of the usual low lamp placing on a fork just above the chassis frame sides, large brackets are used, which elevate the lamp above the tops of the front-fenders, and light the road in a much better manner than is possible with low-placed lamps. This same careful consideration of best results is carried thru the entire construction. There is considerable difference in cost between the 2-cylinder chassis having the motor set lengthwise under the body with chain drive to the rear axles, and one with the motor set crosswise in front under the hood, with the propeller shaft and bevel gear drive to the rear axles. This construction alone it is claimed makes the chassis cost about $200 more.

THE AXLES AND SPRINGS.

The Model C front axle is a steel-tube 2 inches diameter, 5-16 walls, with spring perches and Lemoine type of stub-axle support applied by pinning and brazing. The front wheels are on Timken rollers. The rear axle sectional assembly carries everything on Timken rollers and uses a bevel balance gear. The wheels are held up to a shoulder on the cylindrical outer ends of the axles with hex. nuts, and are keyed to prevent turning.

The top ¼ member of the front spring is one heavy leaf. The lower front spring member is half-elliptic, 36 inches long by 2 inches wide, has 6 leaves and is tongued, grooved and banded. The rear full-elliptics are 36 inches long by 2 inches wide, 6 leaves, banded, tongued and grooved, revolubly supported on the axle sleeves and fixt on top to the chassis frame under side. Neither struts nor torsion arm are fitted as the cardan-shaft housing acts as an effective torsion rod.

The float feed carburetor is a special Northern design, first introduced in 1904, and has been so satisfactory as to have had only slight changes since.

MODEL C STEERING AND CONTROL.

The steering is by bevel pinion and bevel gear sector as shown in the accompanying drawing. The spark and throttle control are by concentric rocker and rocking sleeve, with small handles on top,

Announcement

For 1908 We Shall Have Four Distinctly GOOD Automobiles

1. The Model C Jackson, listing at $1250, a chain drive, two-cylinder touring car, 20-24 H. P.
2. The Model D Jackson, listing at $1500; a bevel-gear drive, two-cylinder touring car, 20-24 H. P.
3. The model E Jackson, listing at $2000; a bevel-gear drive, four-cylinder touring car, 35-40 H. P.
4. The Model E Jackson Runabout, listing at $2000; a bevel-gear drive, four-cylinder runabout, with rumble seat, 35-40 H. P.

The Model C has a planetary transmission, the others have sliding gears, selective type; all have full elliptic springs, rear; every one of them is distinctively a leader in its class; all of them will certainly sustain the well-known reputation of Jackson cars for style, speed, power, and endurance.

he Maxwell-Briscoe Motor Co., was
l to be inadequate, and in 1906 and
two additional plants, one in Paw-
et, R. I., and the other at Chicago
acquired, the combined output of
e being 4,000 cars in 1907. The fourth
ry at Newcastle is now nearing com-
on and all parts of the Maxwell cars
be manufactured at this plant.

e fundamental prinicple of two cylin-
opposed motors for all small cars
g at 20 H. P. or under, and four-
der engines of the vertical type for
igher powered cars will be adhered to.
e season of 1908 will see no radical
ges. The Maxwell two-cylinder con-
ction has reached a high degree of
ection, and the few changes that will
ar in the 1908 product are minor ones,
isting in refinement of less important
ils rather than in departures from the
gn of former models.

e most noteworthy addition to the
well line is the 24-26 horse-power
-cylinder car, which is furnished
either runabout or touring body, and
at $1,750.

oil lights, horn, complete set of tools an
tire repair kit. Despite the additiona
equipment, the price $1450 has not bee
increased.

No change has been made in the doubl
opposed motor of 5-inch bore and 5-inc
stroke. A special feature is the metho
provided for quickly adjusting the mai
bearings. These bearings consist of tw
babbit-lined bronze boxes, behind each o
which is a wedge-shaped piece of stee
controlled by a set-screw. After loosenin
a jam nut the wedges may be forced u
ward, bringing the bearing together an
taking up wear. It is claimed the entir
operation of adjustment requires but te
minutes, and obviates the necessity fo
dismantling the engine.

The unit construction of the moto
clutch and change speed gear, the whol
being mounted in a three point suspe
sion is continued as in previous models.

The largest of the cars Model M, wit
its four cylinders 5x5 inches, rated at 4
H. P., is also continued without an
material change, the price being $3000.

Fig. 1. Model D Maxwell, a new 26 H. P., 4-cylinder touring car, selling at $1750, and a
r as the power plant and chassis is concerned, duplicate in smaller size of the large 40 H. P
uring car. It is well proportioned, and thoroly protected from mud and dust by a sheet meta
n extending from the frame to the running board. This car will also be furnished with
ecial runabout body, built on the lines of the Hammond roadsters, and provided with the usua
auffeur seat, the wheel being tilted proportionately.

he runabout of 12-14 H. P. is carried
r practically as marketed last year,
n the price of $825 is the same.

n steel and perfect alignment is in-
l by a special thrust bearing.

LUBRICATOR.

brication is effected by means of a
tive force feed oiler, in connection
which there is automatic lubrication
he engine case and to the transmis-
A novelty is the unique way in
h the piston is kept lubricated. A
ved brass ring extends around the
r end of the vertical piston chamber;
ring is kept filled with oil by a sepa-
lead and the piston dips into the oil
he end of its downward travel. This
em insures perfect lubrication, at the
e time solving one of the most trouble-
e problems of piston lubrication, be-
e it is often found in ordinary vertical
line motors that the side opposite the
ead is dry on account of the oil being
umed by the heat of combustion be-
it has had time to work around the
e circumference. The superfluous oil
the grooved brass ring drops into the
k case, augmenting splash lubrication.
lubricator is positively operated by
motor and the oiling is absolutely auto-
ic, increasing or decreasing with every
ation in the speed of the motor. A
t feed on the dash gives the operator
ortunity to see that the lubricating sys-
works properly.

IGNITION.

nition is by jump spark, and the cur-
supplied by a set of dry cells and a
age battery, either of which may be
ght into operation by a two-way
ch on the box of a four-trembler coil.

FRAME, SPRINGS, BRAKES.

The rear springs are set out well towa
the hubs, in order to place the load of the
vehicle as near as possible to the point
where the axle enters the hub. Two sets
of brakes are provided, acting on the rear
drums, one set, operated by foot pedal,
being internal expanding; the other
actuated by a hand lever at the right-hand
side of the vehicle, being external con-
stricting.

The Right Place and the Wrong

for Gasolene Explosions

It is a function of gasolene vapor to explode. It is explosions in the cylinders that drive your car along; but gasolene vapor is too apt to form and explode in places other than the cylinders and cause destruction of property and loss of life.

The Bowser Gasolene Storage Outfit

will prevent gasolene vapor from forming and exploding in the wrong place. The **Bowser Outfit** will preserve the life, the explosive quality of the gasolene until it reaches the right place.

For this reason: the **Bowser Outfit** is absolutely air tight; it transfers the gasolene from the underground tank direct to the reservoir of the car without exposing it to the air. And since the gasolene is never exposed to the air, it has no chance to form explosive vapors in the wrong place or become weakened and contaminated before it reaches the right place.

That is one reason why the **Bowser** is recognized throughout the entire country as

The Standard Garage Equipment For Gasolene Storage

There are **Bowser Outfits** for Public Garages and Private Garages, outfits of all capacities and all prices. There are **Bowser Outfits** which **exactly** meet your requirements. secondary current to the plugs.

LUBRICATION.

e oiling system has been modified so
not only is a forced feed oiler used
ubricate the cylinders, clutch, change
d gears and the water pump, but in
tion a reserve tank is placed as an
gral part of the lower portion of the
k case with overflow pipes from the
k case, so that the level in the case
onstantly maintained at the proper
ht, the overflow passing into a re-
e tank below, from which it is again
ped upward into the crank case by a
pump. This small pump is at the
r end of the vertical shaft driven by
iral gear from the middle of the cam
t. The 2 to 1 gears at the forward
of the engine are supported from the
crank case by an oil tight parti-
and the gear case is filled with

springs inserted for gradual engagemen
a special bronze casting is used with cor
inserts. This clutch instead of being en
gaged with one central helical spring i
operated by four springs. The clutch i
provided with an automatic brake whic
prevents it from rotating the gears afte
its disengagement; this brake consists o
a small fibre tipt piston working in
short cylinder, fixt to the central cros
member of the sub-frame. The left peda
operates the clutch alone, while the righ
pedal controls the internal expandin
brakes on the rear wheel drums and als
disengages the clutch. All the brakes fo
1908 are on the rear wheel drums, bein
of the internal expanding and externa
contracting type, metal to metal, the ma
terials being a combination of copper an
bronze in the shoe acting against a stee
drum. These brakes are hinged at th
bottom and opened at the top, and ar
therefore as effective in backing as i
going forward. The third pedal as use
in previous models and the brake, fo
ward of the transmission and on the ca
dan shaft at the rear, have been dis
carded. The brake rod pull is trans
mitted to the brakes thru a system o
ball ended equalizers of the single-tre
type. The steering pivots are mounte
on a double set of balls at the upper en
and a single set of balls at the lower en
the upper set of balls carrying the weigh
and taking the thrust in the direction o
the steering pivot axis, while the othe
set of balls takes the side play, but d
not carry the weight.

Fig. 4. Detail of ball and socket ends use
on the De Luxe carburetor and timer adjustin
linkage. These ends form small flexible con
nections, and are without backlash on accoun
of the spring. They may also be readily take
apart and show refinement of detail which ha
been noticeably lacking on many of the Ameri
can cars.

THE CHANGE SPEED GEAR.

AT LAST! The Perfect Non-Skid

THE NOISELESS S. & W.

INSIDE VIEW OF WHEEL

No More Clashing Chains

No More Broken Fenders or Fender Irons

No More Worry

THE S. & W. NON-SKIDS may be applied and removed without tools and without deflating tires. They are instantly adjusted and stay so until you take them off. The cross chains are attached to flexible steel cables which encircle the wheels at the right points. Tension on chains is regulated by an adjusting strap which secures an even adjustment all around the wheel without binding or chafing the tire. S. & W. Non-Skids will not creep. It is not necessary to have the chains tight to produce the proper result, but it is absolutely necessary not to have them too loose. Our adjustment gives the happy medium and prevents noise and extra wear on cross chains.

Cork Inserts

A great amount of space in the automobile journals has been devoted to the question of friction as applied to bearings and their lubrication, and very little difficulty is to-day experienced by engineers in obtaining satisfactory results in the designing and manufacturing of these parts.

The converse of this proposition arises in the question of brake and clutch construction, where it is desired to absorb power with the least wear, and yet allow the necessary amount of flexibility.

In endeavoring to find a suitable medium having a high co-efficient of friction and the necessary durability, various substances and combinations have been tried, but none have been found to fulfill the requirements as well as cork under the proper mechanical application. The coefficient of friction of cork being .36 is much higher than any other material which possesses the combined qualities of durability, resiliency, non-absorption and its indifference to excessive heat. Exhaustive tests to bear out these assertions have been made in the laboratory of Harvard University, under the supervision of Prof. Ira N. Hollis, and also at the Worcester Polytechnic Institute.

More practical, and perhaps more interesting demonstrations of efficiency have been derived from investigations made by automobile companies themselves, where cork inserts have been put to extensive tests, purposely, intended either to develop any inherent defects or destroy them.

The principal clutch troubles of the present day automobile are excessive slipping with the consequent loss of power; and burning or abrasion of the frictional surfaces, and on the other hand, a fierce seizing when engaging and resulting strains on the car's entire mechanism.

It has been found that by using a certain proportion of cork inserted in sockets in a clutch member, an accellerating engagement is obtained with a greatly increased ultimate holding power, and one that is in no wise affected by the application of oil in any quantity. The percentage of cork to obtain the desired results, i.e., an ideal clutch action, varies in each instance, according to the individual construction and type of clutch.

Other factors to be considered in relation to cone clutches are the mediums used in the frictional face of the clutch, the width and angle of same, the diameter, and the pressure applied. General practice is to construct the cone of aluminum with a view of reducing its centrifugal velocity, and thereby allow an easy and noiseless shifting of gears. This cone is almost universally faced with leather, not that this material is the best obtainable for this work, but that it was adopted by common practice prior to the advent of cork inserts. These have been found to be a superior frictional agent, and when used with a leather facing entirely obviate the great difficulty hitherto experienced by clutch leathers burning out or slipping excessively as a result of an undue amount of oil.

In machining sockets for these inserts, the standard practice is to stagger them across the cone so that the wiping and frictional effect of the cork may be distributed upon its full width. The diameter and depth are matters of calculation depending on the thickness of the rim and the tortional strain. Bosses to receive these corks are frequently an adjunct to this construction, and are cast integral with the cone. These bosses do not add appreciably to the weight of the rim or increase the centrifugal velocity, as there is considerable metal machined out to form the sockets. By the adoption of cork inserts superseding the plain leather-faced clutch, it has been found that a reduction of spring pressure of from 25 per cent. to 50 per cent. can be obtained.

Probably the most original innovation of clutch cone construction is to face the aluminum cone with phosphor-bronze. This facing is merely to protect the aluminum from wear in case of a metal to metal contact; the intention being to allow a sufficient percentage of cork in the driven member to drive entirely on the corks themselves. This makes a practically indestructible clutch, and one that can be depended upon for long life and severe usage. This type of cone clutch is fast gaining favor on account of these remarkable qualities, and deserves careful consideration by the discriminating engineer.

In the plate and disc type of clutch, we are confronted with the metallic area and its proper percentage of cork area and the pressure to be applied, with due consideration to certain minor details requisite to the proper application of these cork inserts.

First. The plate or disc must have sufficient thickness to give the corks a depth proportionate with the frictional work demanded of them, with all due margin of safety allowed to present the possibility of their becoming distorted or torn out.

Second. As a matter of design and bearing in mind that cork inserts protrude slightly above the metal plate or discs, sufficient clearance should be allowed in the release to avoid any drag occasioned by the contact of these parts.

The difficulty caused by the vacuum arising from the oil having been expelled from between the plates is the most serious drawback to the multiple-disc type of clutch. This drag, it has been demon-

TRUFFAULT HARTFORD SHOCK ABSORBER

THE DEVICE THAT MADE

Safe, Speedy and Comfortable Automobiling Possible

The spring action of a car affects its smooth running qualities. Proper control of the springs prevents excessive oscillation, which insures LESS WEAR and TEAR, LONGER LIFE OF TIRES, GREATER SPEED and GENUINE COMFORT.

This control of the springs can be secured only by the use of TRUFFAULT-HARTFORD Shock Absorber—the device that has made SAFE, ECONOMICAL AND COMFORTABLE automobiling possible.

In the 1908 model we believe that we have practically obtained perfection.

A distinctly new feature has been added, consisting of a regulating dial with indicator, making it possible for even a novice to obtain a perfect and uniform adjustment to suit the exact requirements of the car as measured in terms of its gross weight, and easily secure the maximum benefit.

The Truffault-Hartford is the only spring retarding device manufactured with a regulating dial. It is automatically lubricated, absolutely dust and water proof, interchangeable, practically indestructible and fully guaranteed.

The superiority and individual qualities of the Truffault-Hartford Shock Absorber are best demonstrated by the fact that it has been adopted exclusively as equipment by such prominent cars as the:

PIERCE GREAT ARROW, STUDEBAKER, STEVENS-DURYEA BIG SIX, STODDARD-DAYTON SIX CYLINDER, MARMON, CONTINENTAL, LANE, CONOVER, SULTAN, FRONTENAC AND ACME SIX CYLINDER.

ne Matheson Motor Car Co., of Wilkes-arre, Pa., and represented by the Palmer Singer Manufacturing Co., of 1619 roadway, New York City, as sole selling gents, show a few changes in detail, altho ne strictly Matheson features have prac-cally all been retained. Three models n the same 50 H. P. chassis are offered. he first is a touring car seling for $5500; ne second is a limousine, $6500, and the hird is a landaulet at $6500.

is held in a spherically ground fixture lowing some chance for self-adjustm so that the chain will not bind over sprocket teeth. A special arrangen has also been provided for taking up wear in the connecting rod lower end crank pin bearings. This consists o wedge located behind one of the halve the connecting rod bearing box, whic very similar in design to the connec rod ends of steam engines. These wed

Fig. 1. 1908 50 H. P. Matheson Landaulet. This car is on the same chassis as the touri car and limousine. The cylinders are 5x6, with the same arrangement operated by extern roller end levers, as in 1907, the entire mechanism being accessible without getting into t crank case. Make and break ignition is used. The Matheson chassis has simply been refin n detail, while the main features remain the same as in 1907. This landaulet sells for $65 fully equipt.

MOTOR.

The general features of the motor are he same as in previous models, the bore eing 5 inches and the stroke 6 inches. he outside valve operating mechanism as been retained owing to its great ac-essibility. Among the changes which ave been made in the motor, probably he most important has been the change f the cam shaft driving gears from the evel to the spiral type, giving very uni-orm and silent driving. These gears are f special hardened steel, completely in-losed in an aluminum casing and packed vith semi-solid lubricant. In case of any vear on these gears a simple device for lightly changing the position of the gear nakes easy a readjustment. Ease of ad-ustment and accessibility have been argely considered in the refinements in he 1908 cars. The centrifugal pump pre-iously used has been replaced by a pump f the gear type. The reason stated for his change is that a centrifugal pump of ny size, and particularly in the small izes is very inefficient at low speeds,

can be advanced in a lateral directio means of two screws, one on either of the head of the rod. This prov

ing makers of light cars. A new divided gasoline tank is provided on the 1908 cars, the smaler compartment containing but five gallons. This is separated from the other compartment by means of a by pass connection, which is normally kept closed to be used, in case of necessity, as a reserve. This small compartment is automatically filled when the main tank is filled.

The change speed mechanism, with the exception of the gear shifting details, remains the same as in 1907. A double bevel drive on the counter-shaft is used and shorter driving shafts are thus at-

Fig. 3. The arrangement of the spiral gears and casing on the 1908 Matheson, showing the two-to-one gears and the details of the housing. These gears were of the usual spur type in 1907, but all the 1908 models will be fitted with spiral gears, which insure quiet running. A device is also provided by means of which wear in these gears can be compensated for. These gears are of specially hardened steel, completely enclosed in an aluminum housing, and run in semi-solid lubricant.

tained. The change speed gears provide four speeds ahead and one reverse. The change levers are operated by the usual gate system, but all the levers and connecting links and the cross slide tube have been completely covered and protected from road dirt and the weather. The frame is of nickel steel of the usual channel section, but is well trust to counteract any sagging, as it is well known that all frames, no matter of what material, sag after continued use. The multiple jet carburetor, as used in 1907, which is a distinctive type, as it does not employ the ordinary float feed system, is retained. A positively operated pump is used to suck the gasoline from the tank at the rear of the car, force it into the sight feed chamber beside the carburetor body, in which chamber a correct level with relation to the jets in the carburetor body is maintained by an overflow which carries the surplus back to the main tank. It is claimed that this system is not affected by grades, and is free from the disadvantages connected with the pressure feed system. The ignition is still of the make and break type. The Matheson ignition plugs can be reset without necessitating retiming of the motor, and the insulated portion or electrode can be readily removed without disturbing the hammer mechanism. This feature is pointed out as a distinct advance, as in nearly all the high grade make and break ignited foreign cars, the complete igniter has to be taken out when only a slight cleaning of the electrode is necessary. Double counter-shaft brakes controlled by a foot pedal are used, and 14-inch bronze, shoe-expanding brakes are used on the rear wheels. The steering gear is still of the worm and sector type, but the steering gear connections have been somewhat strengthened. A safety locking device has been arranged for the attachment of the steering arm to the link connecting with the steering knuckle. This device consists of a right and left hand plug and cap, which so enclose the ball end of the arm that it cannot pull out. The multiple disc clutch incased in the fly wheel hub is identical with that of 1907, and the lubrication system, consisting of force feed to the bearings, and also splash, has not been altered. The contour of the radiator has been changed to a neat, graceful and distinct outline.

It wil be seen that the 1908 changes consist simply of minor refinements of detail, as the general constructive features of the 1907 Matheson have proven satisfactory.

Pierce Again Wins Chicago Economy

Paul Hoffman, driving Harry Paulman's Pierce Arrow on October 18, won the 200 mile economy contest of the Chicago Motor Club for the Knight trophy, thus winning the Chicago economy test for the third consecutive time.

The meeting of October 31st of the Technical Publicity Association was devoted to the discussion of "The Mailing List in Securing Foreign Business." It was announced at this meeting that organizations modeled on the Technical Publicity Association were being started in Chicago and London, England.

The directory of the trade which is included in the January Journal is revised daily and kept strictly up-to-date. It is therefore the only really accurate and complete directory of this industry. All inactive and "dead" concerns are eliminated, a feature peculiar to our directory, and those who use it therefore waste no time or postage in useless correspondence, as is the case when unreliable directories are used. The January number of the Journal sells at the same price as other numbers, 20 cents per copy, but the best way to assure receipt of a copy is to remit at once $2.00 for a year's subscription, having the subscription start with the January number.

Thomas

1908

4 Types of Chassis, 19 Types of Bodies

Absolutely the most complete line of ***reliable*** cars with reserve power and the prestige of the Thomas name.

This is the Thomas Detroit
4 Cylinder, 40 H. P.

A marvel of lightness and smoothness. It has dash and style in appearance and action that fascinates the expert. With good, wide, roomy seats for five—plenty of room—plenty of reserve power—finely, luxuriously finished—it is absolutely the most for the money in automobiles to-day.

Because of our great increase in facilities, we propose to extend our trade to territories hitherto neglected, and cordially invite all automobile dealers and users to visit our factories for demonstrations and inspection. Pamphlets and photographs will be sent on request.

ere shown.

The case is a strong casting, dust proof nd highly polished. The shaft carrying the ontact wheel holder is supported on two all bearings, adjustable from the outside

The "Connecticut" Timer.

ithout tools and while in operation. Wire onnections are held in cupt washers preenting the breaking of wires. All binding uts have slotted shanks, cone shaped, ting in cone shaped holes, thereby forcing e threads of the binding nuts to the reads of the studs and preventing loosen-g of same. Absolute ground contact on aft is obtained by ball and spring. Con-ct blocks are made of tool steel hardened nd ground to polish and accurately spaced y micrometer index. Contact wheel and vots are tool steel, hardened and ground ue. The contact wheel holder hub, fitted shaft is slidable on Woodruff key and eld in electrical contact by a phosphor ronze spring in key seat, bearing against ey. The insulating ring is of special rocess hard fiber, non-absorbing. The ontact blocks are projected from the in-ulating ring and have V-shaped grooves their inner peripheries, the point of V nd the V groove in insulating ring form-g a continuous and true circular path or rack for the contact wheel which is round to exactly fit the V-shaped groove, aking a perfect electrical connection hen passing the contact blocks. The ob-ct of the V-shaped groove and wheel is ree-fold. First. To form a track for e wheel to travel in without resorting fastenings other than the sliding key. econd: To retain the smooth rolling otion of the flat wheel timer, without its ndesirable features of the wheel picking small particles of dirt, which, lodging the roller and contacts, cause pitting, c., which is prevented in this timer by

contact blocks. The circles being of di ent diameter, the circumferences of same also differ, the outer circle being more than ¾-inch the larger. This is the case in the contact wheel, the o edge of which being also by more than inch larger. Now as the outer edge wheel travels in the outer circle it w revolve 3.16 times around its own during one revolution, and as the in edge of wheel travels on the inner ci it would revolve 4.25 times around its axis during one revolution. The differe between 4.25 and 3.16 being 1.09, it is dent then that as the roller cannot tr in true contact with the outer and the ner edge at the same time, the true tact must be about half way between outer and the inner edge, and a slippin dragging motion is taking place betw the roller and contact to the extent of the difference of 1.09 or .54 of one rev tion of wheel forward on its outer e and backward on its inner edge. slight friction keeps the contacts cl without producing undue wear.

Diagram illustrating the principle involved in causing page of the roller in the Connecticut Timer

The timer is made in all standard si and is carried in stock for ½-inch and inch shaft. It is furnished in bottom side posts, side posts being supplied less otherwise specified. The prices fo 2, 3, 4 and 6-cylinder timers are $1 $12.00, $13.00, $14.00 and $16.00.

Rushmore Searchlight

is not its size (light for light, no other lamp is so small). Nor is it price (size for size, the Rushmore is the highest priced American lamp). Nor is it dressy appearance (the Rushmore looks its part, but it certainly does not look like a brass sunflower).

What sells the Rushmore is just one thing: —the simple, unshakable, foundation fact that it is optically more efficient, and mechanically better built, than any other automobile lamp the world over. The Rushmore Lens Mirror has a shorter focal distance than any other made, and is the biggest the lamp body will contain. It must project the most light. And Rushmore construction is so substantial that the owner will always be proud of his lamps.

Rushmores are everywhere today; ask any Rushmore owner what he thinks of them!

opposite end to take flat link discs which can be opened at one side with a screw driver, and pinched into the slots after the connecting side link has been placed over the rivet ends.

Nathan Strap Tool Rolls

Nathan Novelty Manufacturing Co., 84-90 Reade street, New York City, are now making strap tool rolls capable of accommodating about 30 tools, and adjustable to any size of tool, the straps being laced thru slits and having free play, so that as much or little slack as desired may be allowed for each tool. Two flaps are provided, one on each edge of the main portion of the roll, which fold over the tools, and a strap and buckle is attached on the outside of the roll for strapping up the roll after it is rolled up.

The entire automobile and motor boat trade use the January Journal as a reference book thruout the year on account of its important feature, the complete, accurate, classified directory of the trade which it contains. If you are not a sub-

'Ever-Ready" Vulcanizer for garage and shop use.

vulcanizer is made especially for and repair shop use, being so con-

tube, it being necessary to keep the parts not being vulcanized away from the hot surface.

The "Ever-Ready" Runabout speed indicator was placed on the market to meet the demand for an instrument at a price in proportion to the cheaper automobiles. The speed index is calibrated up to 50 miles per hour. The odometer registers up to 9,999 miles. The instrument lists at $20.00.

This concern has also improved its well known Ever-Ready Tourometer for the 1908 season by the addition of a maximum hand, which registers the highest mileage made thruout the trip.

"Elastic" Tire Filling

Elastic tire filling is a product closely resembling, in its characteristics, pure gum rubber, and having nearly the same elasticity. It is the product of the Elastic Tire Filling Co., 43 Columbus avenue, Boston, Mass.

This substance is put in the tire in a liquid state under pressure, it then hardens to the right consistency. The manufacturers state that all danger of break downs of the car due to punctured tires is eliminated with the use of this filling compound, as a cut of an inch or more will not allow the escape of the filling, thereby preventing rim cutting. The pressure placed in the tire varies according to the weight of the vehicle, the rear wheels always receive a greater pressure on account of the greater weight to be sustained. The price for filling a tire is from $2.10 for a 26, 28 or 30 by 1¼ to 1⅝-inch single tube tire, up to $19.95 for a 32, 34 or 36 by 5-inch tire.

The Graygood Shock Absorber, manufactured by the Graygood Co., 51-55 West Ninety-third street, New York, has been placed on the market for 1908 with no material change in its construction, but has been reduced in price from $75 to $60 per set of four.

The directory of the trade which is included in the January Journal is revised daily and kept strictly up-to-date. It is therefore the only really accurate and complete directory of this industry. All inactive and "dead" concerns are eliminated, a feature peculiar to our directory, and those who use it therefore waste no time or postage in useless correspondence, as is the case when unreliable directories are used. The "Oberdorfer" Carburetor

A new carburetor has recently been placed on the market by the M. L. Oberdoerfer Brass Company, Syracuse, N. Y., the main claims for it being simplicity, ease of adjustment and lightness.

The accompanying cut shows a sectional view of this carburetor. The adjustment and operation of the carburetor is as follows:

In starting, the carburetor is adjusted for slow speed by first raising or lowering the air adjusting nut (589), and when proper mixture is obtained tightening the lock nut (592), which will maintain the position of the adjusting nut (589). The throttle is then opened and the auxiliary air valve (596) for high speed. By turning the adjusting screw (579) to the left it tightens the spring (581), and allows less air in the mixture and vice versa.

Sectional View of the "Oberdoerfer" Carburetor. 579, Auxiliary Air Valve Adjusting Screw; 580, Auxiliary Air Valve Sleeve; 581, Auxiliary Air Valve Spring; 582, Throttle Lever; 583, Throttle Valve; 584, Throttle Valve Shaft; 585, Carburetor Body; 586, Float Valve Lever; 587, Float Chamber Cup; 588, Cup Retaining Nut; 589, Air Adjusting Nut; 590, Needle Valve Stuffing Nut; 591, Needle Valve; 592, Air Adjusting Lock Nut; 593, Cork Float; 594, Float Valve Pin; 595, Float Valve Cap; 596, Auxiliary Air Valve Washer; 597, Lock Nut for Auxiliary Valve Screw; 598, Float Valve; 599, Auxiliary Air Valve Cap.

When the proper mixture is secured the screw (579) is locked in position by tightening the lock nut (597).

The level of the gasoline in the float chamber can be altered by removing the cap (595) and lifting out the float valve and stem (594 and 598). The float valve pin is made to driving fit at the top of the float valve (598), as shown in separate sketch. By increasing the distance (A) the level of the gasoline is raised, and by decreasing the distance the level is lowered. A change of 1-32 inch in the distance (A) changes the level of the gasoline 1-16 of an inch. The lowest speed at which the engine is to be run can be maintained by adjustment of the screw throttle arm (582). When the carburetor is primed (primer at back and not shown in cut) a small quantity of gasoline is caught in the cup of the adjusting screw (589) at the point (B). This insures gas being taken up at the first turn of the engine.

The 1908 "Peerless" Jack, No. 52

In addition to the Peerless jack described in our October, 1907, issue, page 158, the Oliver Manufacturing Co., 203 South Desplaines street, Chicago, has just placed on the market a new model No. 52, illustrated herewith.

All the features of the model previously described are retained in the new model with the addition of a low bracket which

The 1908 "Peerless" Jack, No. 52.

allows objects low down to be raised; that is, objects lower than the top of the jack. This new model is being made in four sizes, two of which have a low bracket.

"Ever-Ready" Asbestos Brake

The Auto Improvement Co., 316 Hudson street, New York City, are on the market with a new brake materially known as "Ever-Ready" Asbestos Brake, which they claim will not burn out nor slip, and is both durable and elastic. This material is fastened to the brake with numerous copper rivets placed 1 to 1½ inches apart and countersunk. Four standard sizes are furnished, the prices ranging from $1.00 to $2.10 per foot.

Everybody interested in the motor car, motor boat and motorcycle trade will find the January number of the Journal of great value, as it will contain a complete directory of the trade—classified according to products—and is therefore called the "Buyers' Guide Special." Price is 20 cents per copy, same as other numbers, or will be included in yearly subscriptions at $2.00.

Helmet Oil Ends Your Oil Worri

Helmet Oil gives the same amount of lubrication on a cold day as hot day. Temperature does not affect it. You do not have to watch lubrication of your car when the days change in temperature.

If you use common liquid oil, the bearings require constant watching. the day is hot, liquid oil becomes thin, flows too readily, the bearings are flo and the supply is exhausted. On the other hand, i day is cold, the liquid oil congeals, flows slowly a very slow acting. Helmet Oil is not affected by or cold. It is not a liquid oil. On account o "body" or density, the temperature of any day not affect it. Helmet Oil does not contain an a of pitch, gum or acid. It will give you perfect s faction on every bearing in your automobile.

The merits of Helmet Oil can be thoroughly de strated on *your* car *free* of expense to you.

Try It Free—Write for Booklet

Send us the name of your dealer and we will have him give you a sample to try. Put it on the bearing that is giving you the most trouble you will find that it will give perfect satisfaction.

Sectional View "Power" Spark Plug.

screws into it, forming a gas tight joint. A very heavy central electrode (E) is used, which is claimed to be non-corrosive. The insulation is double, an extra heavy mica tube (F) immediately surrounding the central electrode (E), and being surrounded itself at the outer end and also at a point near its sparking end by comprest mica washers (G G), the surface of which is highly polished and easily cleaned. Between these two portions of the outer insulation is the metal, threaded collar (D), which screws into the shell and forms the gas tight joint. The price of this plug is $1.50.

The "Imperial" Tire Brackets.

The "Imperial" tire holder, another 1908 addition to this line, is intended as a precaution against theft of spare tires as well as a mere holder, being fitted with a padlock. The entire set includes two side pieces and one base piece on which the lock is provided. The side pieces have straps to encircle the tires, and the bottom piece has a hinged metal cross bar which can be locked down with the padlock. This bracket set will accommodate two tires of any size, and is easily attached to any make of car. The metal parts are of bronze, highly polished.

To-morrow never comes. To be sure of the January number of the Journal, which will contain the Eighth Annual Buyers Guide, send your subscription to-day

The "National" Carburetor

new carburetor, known as the Na-
l, has recently been placed on the
et by the National Auto Accessory

and is adjustable so that when "closed" it stands at any desired distance from the seat, say from 1-64 inch to ½ inch, which can be regulated by the screw on the top of the air valve, and after once adjusted requires no more attention.

It can be readily understood how this would allow quick action when the throttle is quickly opened, after the motor has been running on low throtle. When the valve is said to be opened 1-64 inch when in its "closed" position, the air which comes in is sprayed by the valve, and as the spray is increased the regular action of the valve is not interfered with, as no adjustment of the spring against which the valve opens is ever made, so that the valve opens just the same to accommodate the suction, whether under heavy duty or low duty. It being a non-seating air valve not only makes it distribute the air properly, but it also prevents the constant clatter of the valve. However quickly it is shut down after high duty, it can be adjusted so that it will not smother itself, thereby preventing back fire. This carburetor is especially adapted to motors of the 2-cycle, 3-port type. It is made entirely of brass (except the float), and is furnished in 1, 1¼, 1½ and 2-inch pipe sizes, listing at $16.00, $18.00, $21.00 and $25.00.

Priestley's Auto "Cravenetted" Roseberry and Mohair Cloths

These cloths are of English manufacture, being woven especially for automobiling and outing wear by the Priestley Mills, at Bradford, England, and made into auto garments by the Leon Mann Co., 699 Broadway, New York City.

The Roseberry auto cloth is cravenetted, making it spot-proof and rain proof. It is porous to air, and will not cause perspiration. The cloth has a lustrous finish, and comes in plain and fancy designs and in a wide range of khaki and other colorings.

The English mohairs are made specially for automobile dusters and entire suits for men's and women's wear. They are claimed to shed dust and not to rain-spot or wrinkle. They come in all the new and fashionable designs.

The address of the Lane Motor Vehicle Company is Passaic, N. J., not Poughkeepsie, N. Y., as was given in the summary of exhibits of the Grand Central Palace Show in the November, 1907, issue.

e "Reliable" Compound Tire Pump

swiveled handle which prevents binding and cutting the piston rods. Each pump is tested to 200 pounds pressure before leaving the factory. The list price of the pump is $5.00.

Improvement in the Crouse-Hinds Commutator

The Crouse-Hinds commutator, made by the Crouse-Hinds Co., 341 Walton street, Syracuse, N. Y., has been placed on the market for the 1908 season with an improvement in the shape of the knife blade contact or cam which is now made to cause a quick break of the circuit, with the consequent effect of prolonging the life of the contact.

Sectional view of the Crouse-Hinds 1908 Commutator.

The principle of this commutator is the making of the contact by a hardened steel cam passing between two steel balls held against each other by coiled springs. The price has also been reduced, which the concern states is due to the recent installation of a considerable amount of special machinery, together with the purchase of material in very large quantities.

The "Pagel" tank gage, described in our November number, page 196, is now made by Edmund E. Haus Co., 424 South Fourth street, Minneapolis, Minn., all patents, etc., having been purchased by this company from the former manufacturers, Wm. F. Pagel Co.

Our next issue will be the Great Buyers' Guide Special, and will contain a complete, classified directory of the industry. It is one of the most important issues of the year, especially from the tradesman's point of view, and if you are not a regular subscriber to the Journal you should not delay an instant in sending your subscription so as to begin with the January

Mr. Dealer:

Are you "IN RIGHT" for

1908?

Are you handling the right line of cars?

Are you handling a line that worries you half to death to keep the cars going and to keep the owner satisfied?

Do you feel like you wanted to find a hiding place every time you see a user of one of your cars coming?

Are you handling a line that makes every buyer a "booster" for you, or are you handling a line that makes every buyer a "knocker"?

Does every car you sell help sell another, or does every car you sell prove a boomerang?

Do you have to cut prices because your cars wont sell at list?

Are you handling a line that people want, or do you have to work to sell them something they don't want?

Does the manufacturer properly protect you in your territory?

In other words, are you entirely satisfied?

If you're not, now is the time to commence figuring on what you are going to do for 1908.

The

line is the strongest proposition in the automobile business to-day, and next year it will be stronger than ever.

We are stocking up on material and preparing for 1908 now, so that deliveries will be made promptly throughout the season. That's an important item.

We will be prepared to handle some new territory that we haven't been able to touch before because of lack of cars.

A few "dead ones" among our dealers may be weeded out, because our output next year will be greater than ever, and we want only "live ones."

If you are open to consider the line that almost sells itself write us. Tell us who you are, what you are now handling, how much business you have done, and what you think you can do with the Cadillac.

CADILLAC MOTOR CAR COMPANY

DETROIT, MICH.

Members of Ass'n Licensed Auto. Mfrs.

Hosted by Google

on each end. The entire weight of the vehicle is carried on the axle tube construction, thus removing all strain from the driving members.

The housing is made of a single crucible steel casting, and all the bearings supporting the transmission and differential systems are cast solid in this housing, in this way avoiding the possibility of disalignment to any of the gears or ball bearings.

The differential, secondary shaft and main propeller shaft are removable thru the opening in rear of the axle; the sliding transmission gears, also the lay shaft and other bearings comprising the transmission system are removable thru the cover over the transmission, thus avoiding the necessity of taking the axle from under the car for any necessary adjustments or changing of parts.

The rear axle, propeller shaft and tortion tubes are of chrome nickel steel. The tortion tube is securely fastened in the forward end of the main housing, and is provided on the forward end of the tube with a steel casting, which is provided with a ball thrust bearing, and an annular ball bearing which supports the forward end of the propeller shaft. The end of the propeller shaft is of 1¼-inch square section. The tortion strains due to stopping and starting the car, also the driving torque is transferred thru the tortion tube directly thru a cross member to the frame in a simple and effective manner. The maximum amount of flexibility that is required by the axle is obtainable thru a spherical member which is clamped to the forward end of the tortion tube, and is provided with a spherical connection to the cross member, the centre line of which should be on the same centre with its universal joints and radius rods, if same are used.

The brake system is provided with an internal and external brake, which are applied on a brake drum which has 1-inch air space between the internal and external drum. This air space contains a number of thin veins, which are cast between the two drums at an angle of 20 degrees, and which acts as a fan for the purpose of circulating the air thru the brake system.

The internal and external brakes are lined with camel's hair. The front axle is of I-beam section and is made of a solid drop forging.

The mounting of the steering knuckle is of a very novel construction, as the entire weight applied at this point is taken on a 1-inch ball which is placed at the top of the vertical column of the steering knuckle. The manner in which this is adjusted and accomplished is shown in the accompanying photographs.

The Value of a Trade Directory

The value of a trade directory is gaged not by its enormity, but by its accuracy and the activity of the concerns listed in it, as well as by its arrangement to permit easy reference. Judged by this standard the directory of the automobile and motor boat trade which is included in the January number of the Cycle & Automobile Trade Journal is pre-eminently the best directory of its kind. As it is revised daily, and as its publishers are constantly corresponding with every concern listed in it, the chance of retaining names of inactive concerns is practically eliminated, and the directory is therefore absolutely accurate up to the minute of going to press.

We originally published an annual directory of the trade in book form, and sold same for $1.00 per copy, but in late years, for the convenience of the trade, we have included this directory in the January number, so that at the beginning of each calendar year every subscriber is "automatically" supplied with the most complete and accurate trade directory extant without effort on his part excepting his annual remittance of the subscription price of the Journal. For several years we charged extra for the January number on account of this valuable directory, but last year we sold this valuable number at the same price as other numbers, and will follow the same practice in regard to the next "Buyers' Guide Special," as the January number is called, the price of which will be 20 cents.

All our subscribers will, of course, receive the January number—the "Great Buyers' Guide Special"—just as other numbers, and we therefore urge all non-subscribers to remit $2.00 at once so as to have their subscriptions start with the January, 1908, number. Send remittances to the Cycle & Automobile Trade Journal, Forty-ninth and Market streets, Philadelphia.

Besides its completeness, and its entire lack of "dead wood," the Journal's trade directory is arranged in practical form and fully indexed for easy and quick reference. All active makers in each particular line are grouped under a suitable heading, such as "Gasoline Automobiles," "Motorcycles," "Motor Boats," "Gasoline Automobile Motors," "Carburetors," etc., etc., and a complete index of all headings is also given, while the various groups are placed alphabetically according to their headings.

C. B. Warren, for several years manager of the New York branch of the Haynes Company, has succeeded Frank J. Fanning as sales manager of the Haynes Automobile Company, of Kokomo, Ind.

The Warner Gear Co., of Muncie, Ind., informs us that it is about to move into its new steel and concrete factory, which will more than triple its capacity. This concern manufactures transmission gears, **both sliding and planetary types, selective side control levers, steering gears, and both spur and bevel gear differentials.**

Won in the Glidden Tour

Won in 1906 Won in 1907 in the Glidden Tour

Last year 38 out of 62 Cars entered in the Glidden Tour were equipped with Warner Auto-Meters, as compared with 55 out of 74 this year. At the finish last year 10 Cars out of 13 with perfect scores had Auto-Meters, and this year 36 out of 48 Cars that finished had Auto-Meters.

Won in the Sealed Bonnet Contest

Out of 68 Cars in the Chicago Sealed Bonnet Contest, 26 had Auto-Meters—the nearest competitor of the Auto-Meter had only 16 and the next 14, the next 7 and the rest—"nowhere" with 2 and 1 each.

Practically all Route Books Are Compiled by Auto-Meter

including *Motor Guide, The White Route Book,* Sidney J. King's Book, and the Routes issued by the *Automobile Club of America.*

From start to finish in the far-famed Glidden Tour this year the **Warner Auto-Meter** helped to win most of the perfect scores for the contesting cars. The **Auto-Meter** was installed

On 55 Out of 74 Cars AT THE START

in Cleveland. In this awful endurance test of keeping absolutely accurate figures on "How Fast" and "How Far" to Chicago, and then on to New York under some of the fiercest road conditions, there were **36 Auto-Meters on the 48 Cars that finished** at New York—**75 per cent** of the **Winners.**

Victory for The Warner Auto-Meter

On 36 Out of 48 Cars AT THE FINISH

That's going some. It's a victory for the **Auto-Meter** which might have been anticipated, because—

The magnetic principle which makes the **Auto-Meter** as reliable as a mariner's compass makes it unnecessary for the shaft to run at such a *wearing* high rate of speed, as on other speed instruments.

Consequently, experienced Motorists, like the Glidden Tourists, know that the **Auto-Meter** is the instrument that can be *depended* upon to stand hard endurance runs and *accurately tell* the *speed* and distance made by a car *from* start *to* finish without wearing out or being put out of commission like others.

That is also the practical reason why you'll see the **Auto-Meter** on the *Cream of all Cars* on any road.

Watch any line of Motor Cars anywhere—you'll see the handsome little **Auto-Meter** on the dashboard of the best of them and the most of them—then you'll decide that

You ought to have an Auto-Meter on Your Car.

Agencies in All the Principal Cities

New York

Won in Almost Every Contest

The Auto-Meter is so immensely popular with motorists everywhere and it is so universally used and depended upon to tell speed and distance figures, that it is only natural that it should be used by experts in all great contests and win the most victories

Won the Chicago Reliability Run and Boston Endurance Race

In both of these hard tests the **Auto-Meter** was used by the majority of the entrants, and proved absolutely dependable under all trying conditions.

THE STEWART

Has no maximum hand or other useless contraption.

¶ The great success and popularity of the Stewart Speedometer has been achieved, because of its indisputable accuracy, dependability and mechanical perfection. It is built to indicate the speed and distance traveled and nothing else and keep on doing it.

¶ We don't cumber our speedometers with a lot of valueless contrivances that can add nothing to their usefulness or reliable operation. Does the maximum hand serve the purpose for which it was made? Surely no court is expected to accept as evidence something that can be manipulated at the will of the defendant.

¶ Such contraptions are not improvements, but are a source of confusion and disappointment to many that have tried them—Stewart Speedometers have always given excellent service and entire satisfaction to car owners that want a real speed indicator and mileage recorder.

$40

We exhibit at all the shows

pencer power tire pumps have made improvements on the pump for 1908, also brought out a new tank gage, ically operated, which consists of a sliding up and down a vertical n, which extends down into the ne, this float being connected with arranged so that it can be brought connection with a dial indicator, d on the dash in front of the driver. olumn which extends down into the ine is of hard rubber and carries its sides brass strips, each strip insulated from the strip above, the

cator of the Spencer Electric Tank Gage.

e forming two tracks for small rollers, n are on the float and are kept in ct with the brass strips by means of itable spring. As the float rises or with the rise or fall of the gasoline rollers on the float are brought into act with the successive sections of strips and by pushing a button on dash indicator, the electrical circuit een the battery and the float is com- d and a small electric globe throws ght beneath the proper numeral or r on the indicator, showing whether tank is full, three-quarters, one-half, quarter full, or empty, as the case be. Each pair of sections of the s strips one in each side of the mn is connected to the lamp under numerals corresponding to the posi- of the float at that time, so that when button is pushed, the light will be wn on the proper number.

but is soldered to the tank separately, and can therefore, be used on either pressure or gravity feed tanks. The current is taken from the ignition battery.

The improvements on the Spencer tire air pump consist of making it more compact and of changing the method of connection with the crank-shaft, so that it can be used on any make of car.

The Auto Pump Co. furnish a complete starting handle for any make of car, if necessary, so that this pump can be used, the pump being operated from the crank-shaft.

Archer Gasoline Storage System

The Archer Tank Company, 76 West street, Rutland, Vt., is putting out a new gasoline storage system after a long series of tests which, they claim, have shown conclusively that its use prevents all loss from evaporation and eliminates water and dirt from the gasoline. The apparatus is of the simplest form, and consists only of common valves and piping fully understood by every plumber. Pumps and their complications are avoided, and all that is necessary to deliver gasoline is to open the valve and to close it when thru. This system uses the well-known principle of water displacement, and the gasoline is drawn from the top of the tank, while all water and sediment remain at the bottom and cannot possibly be drawn out at the gasoline valve. The tank is carefully made of heavy boiler steel riveted and caulked, is buried in the ground for safety and convenience, and is guaranteed against explosion or danger in case of fire. The apparatus is equally well adapted for use with kerosene or any oil, but is of especial value in handling gasoline.

Automobile Wiping Towels

Mr. George S. Browne, 303 Canal street Providence, R. I., has devised a strong porous and very absorbent wiping towel to be used for cleaning automobiles, cycles and other vehicles, as well as machinery in general. It is of handy size, double hemmed. The price is $4.00 per gross and a discount is given to the trade when great gross lots are purchased.

Planet Motor Co., 280 St. Nicholas avenue New York City, is about to place on the market a new 6-cylinder, 2-cycle motor with revolving air-cooled cylinders. In this motor, called the "Planet," a pump is used to deliver the fuel to the cylinders

Goodyear Leads

1908 "Pedersen" Type C Oiler

e Pedersen Mfg. Co., 636-644 First ue, New York City, has just added w oiler to its line, specified as Type The chief claim made for this oiler mplicity of construction, this model ; even more simple than its predeces- of which it is a refinement.

e operation of the oiler is as follows: leading to the bearings to be lubricated on the other, it will be noted that in the first quarter of the motion, the rocker shaft is rotated, thus filling the pumps from the receiving ports, and at the same time discharges the oil from the opposite ends of the pumps to the bearings. In the second quarter, the slide is moved lengthwise, till it registers on one side with the delivery ports, communicating to the Sight Feed and Regulators, the other side with the ports leading from the same. In the third quarter, the rocker shaft is rotated back and forces the oil to the Sight Feeds, at the same time filling the opposite ends of the pumps with oil

Sectional view of the "Pedersen" type C oiler.

from the Regulators. During the last quarter, the pin moves the frame back to the first position. The overflow from the Sight Feeds passes back into the tank. These operations are repeated as the wheel is revolved.

The Sight Feed used in connection with this oiler is the same in construction as the one described in our September 1906 issue, page 144 with the addition of a few improved details.

The "Door Knob" Dome Lamps

In addition to the new dome lamps de- scribed in our October number The Storage Battery Supply Co., 237 E. Twen- ty-seventh street, New York City, has another new dome lamp called the "Door Knob," as the bulb is about the shape and size of an ordinary door knob.

The new lamps for both exposed and recess work, are made with a bulb screw- ing directly into the center of the reflector

Buggy-Type

ENGINE

The one best engine for buggy-type automobiles; also suitable for any light runabout or light delivery wagon.

Two cylinders, 4x4, double opposed. Air-cooled, 10-12 H. P. (conservative rating.) Weight including flywheel, 180 lbs. Over-all dimensions, including spark plugs: length, 30 in.; width, 16¾ in.; depth, 17 in.; depth without flywheel, 11½ in.

This is a high grade, carefully constructed engine, perfectly balanced and free from vibration. Every engine fully warranted to deliver the rated power and keep cool. Has been run at full speed for six hours without a sign of distress.

Prompt Deliveries
Attractive Prices in Quantities

The Voice of the Road

YOU Never Have to Wait,

Prest-O-Lite

IS EVERYWHERE

Over 1600 replacing stations where Prest-O-Lite users can have their Prest-O-Lite tanks exchanged without a moment's delay.

Our Five Main Stations

have 10,000 filled tanks of Prest-O-Lite ready to loan to responsible dealers everywhere—a filled tank of Prest-O-Lite is ready for you at nearly every garage, from the Atlantic to the Pacific.

CAUTION - Prest-O-Lite Gas Tanks are being imitated by concerns who are putting out tanks like Prest O-Lite Gas Tanks of three years ago. Your Prest-O-Lite Tank has all the new improvements shown most practical by three years' more experience. Prest-O-Lite Tanks are thus much more valuable than imitations which cannot be supplied promptly.

In exchanging yours see that irresponsible dealers don't keep your Prest-O-Lite Tank and give you a cheap imitation. Be sure to see the name Prest-O-Lite on the tank you get back to protect yourself.

The Michigan Universal Joint

Michigan Wheel Company, of Grand , Mich., who are widely known as acturers of high grade propellors for boats, have lately brought out a sal joint for use on shaft driven obiles and in similar constructions. xterior view herewith gives a good

B 4 inches, C 3 inches, D ¾ inch, E 1 inch, and in this size the wearing surface or frictional area of the journal is 9⅜ inches. In the other two sizes the dimensions and areas are proportionately larger.

Construction Details of the New Michigan Universal Joint.

This universal joint can be disjointed and put together again, we are informed, in one-half minute without special tools, this being accomplished by removing a cotter pin from the journal and a pin from the center block, thus unlocking or separating the two halves of the joint. The joints are bored and key-seated to fit any size propellor or engine shaft.

Besides the regular pattern this company is prepared to make special universal joints for any purpose and to meet any particular requirements. The large bearing surface makes this Michigan universal joint durable and strong and specially suitable for the constant work it is called upon to do in automobile and motor boat use. The center block is hollow and contains enough oil to last a season. Provision is made to prevent the oil from being thrown out by centrifugal force and to keep out dirt and grit from the bearing. Felt washers are used in the recess at the end of the bushing at the center block pressing against the face of the fork at the only place

The Michigan Universal Joint, Exterior View.

where the lubricant can possibly come out, thus making the joint absolutely dust and oil tight. This feature makes it unnecessary to use leather or metal covers on these joints. The journal pins are of hardened steel, ground, and are interchangeable. All bushings are of hardened steel and are prest into the center block under a pressure of ten tons, after which they are upset and ground to fit the journal pins.

THE R. E. HARDY COMPANY

ruction, chief of which is a double . This instrument is manufactured he Veeder Manufacturing Co., Hart- Conn., and is fitted with a universal ket which makes it possible to at- the instrument on nine-tenths of cars now on the market.

e operation of the new tachodometer, double scale is as follows: The ber in the lower part of the instru- holds a colored liquid, which, upon

The "Veeder" 1908 Tachodometer.

volution of the paddle is thrown out- l by centrifugal force and rises in the , the height to which it is raised in tube depending upon the speed at h the paddle wheel is revolved. When liquid in the tube to the zero mark in case of any evaporation of the liquid.

The paddle is divided into two diameters which practically makes it two paddles. The object of this is in order to avoid having an extremely long scale to get high readings. By means of the two-way valves the liquid is made to pass from the smaller diameter of the paddle to the tube or from the larger diameter of the paddle to the tube, as desired. The small diameter of the paddle is of course used for the high speed readings, and the large diameter of the paddle for the low speed readings. When the two-way valve lever is parallel to the tube, it is adjusted for the low speed reading and is read on the scale on the right hand side of the instrument, and when the two-way valve is pulled forward it is then adjusted for the high speed paddle and is read on the scale on the left hand side of the instrument.

If when the car is running at a given speed and the valve moved from the position for the large diameter of the paddle to the position for the small diameter of the paddle, the column of the liquid would drop down to half the reading which it had before on the low scale, which of course allows the liquid to mount higher in the same tube when reading on the high speed scale. The instrument as usually made is furnished with 30 and 60 mile scales, but can be furnished with other scales if so desired.

Winship Tonneau Pocket

W. W. Winship, of 71 Summer street Boston, Mass., has added to his line for 1908 a very handy accessory, the Winship Tonneau Pocket, which we here illustrate These pockets are furnished in material to match the upholstering of the car, and are very useful receptacles for gloves

c avenue, Boston, Mass., has recently ght out a new ball bearing timer, h they guarantee to run for 60,000 s provided it is kept thoroly lubri- d and points of contact (which are dard ⅜-inch steel balls) are renewed ften as every 5,000 miles.

e ball bearing is simple in construc- and is adjustable. The ball races are rge size, each containing twenty-one nch balls, thereby insuring long life rigid bearing and by this arrangement possible to guarantee absolutely ac-

tional and top views of the "Bemus" Dou- all Contact Timer.

te timing for an immense amount of age. By the use of felt and fibre ers the timer is rendered practically roof; what little oil does escape has dency to take the dust and dirt away the bearing and makes the timer ly dust or dirt proof.

e construction of the sockets carrying centre and outside contacts has been ged, the centre contact being brought the axis and the outside contacts ex- ed in thru the insulation farther, so any specified number of degrees of act may be obtained with very slight ssion of the balls in passing each

cated with any lubricant of a non-fluid con sistency. The timer has a ground contac connection for a wire to conduct the cur rent back to the battery, and on accoun of the construction of this contact it is a positive and especially direct connection The timers are made for 1, 2, 3, 4, 6 and 8 cylinder motors, and list at $11.50, $12.00 $12.50, $13.00, $15.00 and $19.00.

New Pedal and Muffler Cut-Out

The Garage Equipment Co., Milwaukee Wis., has recently placed on the marke two new automobile devices, viz: a new muffler cut-out and a new foot pedal.

The G. E. Co.'s Muffler Cut-out; Style C.

The feature of the new muffler cut-ou is the fact that it does not necessitate the removal of the exhaust pipe to apply it All that is necessary is to cut a hole in the pipe and clamp the cut-out on and connect to the foot-board. This cut-ou lists at $3.00 with spring, and $3.25 ma chined.

Dealers' Department

The Mutual Electric Company

RAMBLER AGENCY OF DULUTH, MINN.

The Mutual Electric Co., 112 West First street, Duluth, Minn., agents for the Rambler, Reo and National cars, attribute building up of a successful automobile agency to conservative business methods, systematic advertising and careful attention to the needs of their users. The method of advertising employed has been through the local papers principally, altho a few billboards containing cloth posters have brought results. The local papers in Duluth are distributed thruout the entire State, and as far West as Montana, giving a good field for advertising. Several stunts in the way of using cars for hunting expeditions have been pictured on postal cards and widely distributed. The company states that some of these exploits were taken up by the daily papers, and gave them considerable publicity. But in the long run it has been found that the best results were obtained by personal calls on prospective purchasers. As far as possible these calls are made by one man who has shown himself to be able to bring results. The company do very little trading in second-hand cars, altho machines are sometimes taken when it would mean the placing of one of their own line in a particularly good field, where it is believed results might follow.

A model garage fully equipt with the necessary machinery and hand and bench tools is run in connection with the agency. This garage is in a steam-heated, fireproof building. The statement is made that no trouble whatever has been experienced with chauffeurs inclined to graft, as no dealings are made when such tendencies are shown, the management stating that they would rather go out of business than cater to this class of trade. Prices are fully maintained on the sale of cars, and at no time have prices been cut.

In approaching a customer who is about to complete a sale it has been found best not to require him to sign a long contract covering the type, description and details which he is about to purchase, but simply to require of him a deposit as first payment, the receipt for which is an acknowledgment from the office of the amount. This does away with a voluminous document which it has been found in many cases somewhat frightens a purchaser due to its very legal look, and many customers hesitate somewhat in signing a long contract, as there seems to be too much legal matter to the transaction. Better results have been obained by simply taking a small payment and acknowledging a receipt of the deposit, after which there is plenty of time to obtain signatures to the final contract.

The company states that they have placed a large number of cars in their city this past season, and feel well satisfied with the results. The company would like to hear thru the columns of the Journal expressions and views from other agents relative to business and business methods.

A Carthage, Missouri, Agency

The Carthage automobile garage, in charge of Mr. H. C. Griep, are agents for the Maxwell line. One of the reasons that this company assigns for the sale of a large number of their cars is the fact that they get after the customers and stay with them until a result is obtained one way or the other. In regard to trading in second-hand cars the statement is made that none whatever are taken. A garage fitted with some repair tools, air pump for tire inflation, etc., is run in connection.

FOR BETTERING THE AGENT'S CONDITION.

When questioned as to methods which result in the betterment of conditions for the agent it was said that the suggestion that the agents thruout the country insist upon some other method, and taking up forfeits to obtain an agency be used. The present method is for the manufacturer to insist upon a deposit for about ten or more cars to the extent of ten per cent. of their value, or some set amount on each car, as fifty or one hundred dollars. This ties up for practically the entire season a large amount of capital. The Carthage Automobile Garage Co. believed that if the manufacturer must insist upon having a forfeit, a more equitable method would be as follows: Suppose the manufacturer insists on an agent taking ten cars and making a $100 deposit on each, in place of asking the agent to deposit $1000 have him deposit instead $200, but apply this $200 on the last two cars of the ten. This would give the manufacturer an assurance that the agent would make a special effort to sell the number of cars contracted for, and would not tie up a large amount of capital. The company would like to hear this matter discussed by other agents, and if possible have it taken up with the manufacturers.

A Live Bridgeport Agency

The Lyford Brothers, 625 East Washington avenue, Bridgeport, Conn., agents for the Oldsmobile, state that one of the features which has probably more than any other one cause built up their business is the earnest personal work of the members of the firm. Nothing of extreme importance is entrusted to uninterested employees, a large part even of the demonstrations being personally attended to. The company feel that at the present time there are so many inexperienced, and to a certain extent irresponsible and careless young men connected with the automobile business that the safest plan is to attend as far as practicable to all prospective purchasers personally. Every effort is made after a sale to see that the customer is well satisfied, and the statement is made that nine-tenths of the sales are directly due to satisfied users.

Careful attention is personally given to the repairing of customers' cars, a completely equipt machine shop being a most important department, but as far as possible a large stock of duplicate parts is carried, replacements with which cause less delay, and are more satisfactory than making up parts, as is often done when no stock is carried, and it would otherwise be necessary to send to the factory. In other words, every effort is made to keep the cars which have been sold always in working order and on the road. By carrying as complete a stock of parts as possible, even including duplicate complete springs, etc., these unnecessary delays to customers have been avoided, and in proportion the users have been pleased.

The Schaffer Manufacturing Co., of Baltimore, Md.

The Schaffer Manufacturing Co., of 406 North Talbert street, Baltimore, Md., has recently entered the field of automobile agents and handles the Pullman and Jackson cars. Altho this company has been but a comparatively short time in operation as automobile dealers, altho well established as machinists, the number of cars sold is reported as being very gratifying. In practically every instance the sales were traced to individual efforts, keeping continually after prospective customers. After sales are made the cars are occasionally looked over and given proper attention and adjustment. The machine shop in connection is said to be one of the best in the city, every facility for properly repairing automobiles being included in the equipment; in fact, much of the work of the shop is for garages in and around Baltimore. The statement is made by the sales manager, Mr. I. M. Schaffer, that grafting chauffeurs are doing more to harm the automobile business in his opinion than almost anything else could, and that the company has lost considerable trade by not complying with their requests.

Pittsburg Dealers Organize

An organization known as the Automobile Dealers' Association of Pittsburg was incorporated on August the 20th, comprising about seventeen of the largest dealers in that city. The association has secured offices at 5919 Baum street; has established there a Notary Public in order to accommodate the automobile trade in so far as automobile licenses are concerned, having arranged to obtain the licenses quickly to accommodate their patrons. Also to keep a list of chauffeurs in the office. Mr. W. N. Murray was appointed president; A. H. La Fountain, vice-president; A. T. Banker, secretary, and G. P. Moore, treasurer. The association will hold an automobile show next April 4-11, 1908, at Duquesne Garden.

Scientific Salesmanship

An interesting departure from the ordinary school of instruction is a course of the Science of Successful Salesmanship, from the Sheldon School of Correspondence in Chicago, in which the school endeavors not so much to appear as a tutor, but more as a helper in bringing out the undeveloped natural qualities in its students and making them successful salesmen. Not merely salesmen of an over supply of merchandise, but salesmen of goods sold at a profit. This science is not built upon a theory, but upon the actual methods used by every successful salesman, whether he sells the necessary commodities of life, is a specialty salesman or a promoter. This science is an earnest attempt to formulate a wealth producing system of special education, which not only appeals to the seller or distributing class, but also is of great importance to the manufacturers or producers.

The St. Louis Automobile Manufacturers' and Dealers' Association will hold an eight-day exhibition in the Jai Alai Building, beginning December 14, and closing December 21.

Cleveland's automobile show will be held the week of February 17, under the management of the Cleveland Automobile Dealers' Association.

The New York Automobile Trade Association was recently advised by the General Freight Agent of the Hudson Steamship Line that they are now in a position to allow gasoline motor trucks on their piers.

About two hundred agents from all parts of the country attended the fourth annual convention of Maxwell dealers, which was held in the lodge room of the Grand Central Palace on October 28, and followed by a banquet at Hotel Manhattan.

For Cleaning Auto Bodies

It's good to see how quickly Mobo removes mud, grease and dirt from an automobile body. It doesn't matter how long the car has gone without cleaning, or how thick the dirt may be—off it comes, easily and quickly if you use

MOBO

Automobile Cleanser

Not only does it remove all the dirt, but does it without marring or scratching the varnished surface, and without dimming the lustre in any way. That's Mobo style.

Mobo is composed of pure vegetable oils, and contains nothing rough to mark the smoothest surface. It is the ideal automobile cleanser.

Prevents the varnish and paint from cracking and blistering. Keeps the car looking new. It's the best sold to-day. Try it once and you'll understand why.

Put up in 8 lb. and 6 lb. cans; also in tubs, half-barrels and barrels. Can be had at the following supply house:

CASSIDY, DAVY & CO.
20 St. Paul St.
BALTIMORE, MD.

and at all good automobile supply stores in all leading cities.

Send for our Mobo booklet —"*How to Clean Well Varnish and Paint on an Automobile*"

Wico

You don't have to gue with the Wico Spa Plugs with Micromet Adjustment.

The gap can be set to a KNOW DISTANCE—1/1000 of inch, and all plugs can be alike, to suit your compressi ensuring rhythmic running.

The electrode and chamber so constructed that WIC PLUGS are practically self-cle ing. Can also be taken ap without disturbing the packi or altering the adjustment.

Wico Spark Plugs

are made in all standard siz Price $1.00. A sample sent up receipt of price.

Experiences of Commercial Motor Car Users

"Rapid" Truck Replaces Four Horse Wagons at Much Less Expense

Barcalo Manufacturing Co., Buffalo, N. Y., maker of metal beds, bed springs and bedding, uses a Rapid motor truck in its delivery department, the truck having replaced four horse drawn wagons. The daily expense of maintaining the motor truck has averaged $5.54 3-5, including $4,069 driver's and helper's wages, .339 barn rent, .789 for gasoline, .127 for oil, .222 for repairs and sundries. These figures and those to follow are all based on the actual experience of the owners of from March 19 to October 10.

This truck has been used on an average of 9.1 hours per day, covering 28.3 miles daily, and 23 stops per day were averaged. The daiy consumption of gasoline was 4.7 gallons, and of oil 2.11 pints.

The average expense per mile is apportioned as follows: driver and helper, .1438; barn rent, .012; gasoline, .0279; oil, .0045; repairs and sundreis, .0078; total per mile .1960. The gasoline consumption per mile was .17 gallon and of oil .07 pint.

Successful Delivery With Motor Cars in a Large Grocery Business

The Delmonico Company, Savannah, Ga., Leigh M. White, president and manager, are large wholesale and retail dealers in fancy groceries, teas and coffees, and showed their progressiveness over two years ago by purchasing a Cadillac car for the purpose of testing the fitness of the motor car for delivery service. This car was second-hand when they bought it, having been in use something like two years. and it had an open body, but the company had a cover made for it, converting it into a closed vehicle. This addition made the body rather heavy, and the machine was therefore carrying more than it was intended to, but in spite of this fact it gave very satisfactory service. The expense of repairs, storage and gasoline approximated $75 a month, but this is good in view of the fact that the car carried from 700 to 1200 pounds loads when it was only intended to carry from 500 to 600 pounds. Besides delivering as much goods in the city as two of their horse teams. it made three trips to the country (about eight miles and back) each week, carrying a load of about 1000 pounds each trip. in addition to the driver.

They were so well pleased with the results obtained that in August of this year they purchased another car, a 22 H. P. Buick chassis, and had fitted to it a body built after their own plans. This machine is now in use and doing the work of two to three teams satisfactorily and at small cost, and Mr. White is having the machine kept at his private garage. and cared for under his personal supervision. The first car is being overhauled, and will again be put in use with several improved features.

In addition to the value of these cars as deliverers of goods, Mr. White states they are excellent advertisements, especially in view of the fact that this company is the only concern using gasoline machines for delivery purposes in their city, and he feels the advertisement should be credited against the expense of running the machine. These machines make three or four calls per day, averaging 30 to 100 calls per trip, and the territory covered is about two square miles, excluding the long distance trips. The operator is paid $40 a month and no helper is provided. Only the Buick is now in use, but of course another driver will be added to operate the Cadillac when it is overhauled. The present driver was formerly a team driver. The Cadillac car cost them $600 and the Buick $1200.

Salesman Covers Territory in Less Time with Motor Car than by Rail

A Worcester Massachusetts salesman has found that while a motor car incurs greater expense in covering a certain territory than railway car fare, it enables him to cover it in much less time, and therefore cuts down hotel expenses and increases his annual earnings by enabling him to cover more territory. and thus sell more goods in any specified time.

His motor car cost, with lamps $812. In covering a certain territory he used 316

Hosted by Google

gallons of gasoline, costing $69.45, and 16 gallons of cylinder oil costing $12.50. Replacing three tires shoes cost, including expressage $64.50; repairs to engine $33.80; grease and minor supplies, $2.75; repairs to springs and axle, $6.45; spark plugs, $2; 21 sets of dry cells, $52.30, and storage, during the time consumed in this trip, 6 months, $91. Interest on his original investment of $812 for 6 months at 6 per cent., $24.36, should be added to these expenses, bringing the total expense to $359.11.

To have covered the same territory by rail would have required 7000 miles on the railroad, which at 2c per mile would bring the railway expenses up to $140, not counting any extras for parlor car seats, etc. The saving in time with the motor car was 9 weeks, in which time $180 more would have been spent in hotel bills had the trip been made by rail. This makes the expense saved by the motor car total up to $320. The apparent difference of $39.11 in favor of the railroad is more than offset by the increased earnings of the salesman.

In addition to keeping correct cost of running, he also kept tract of the time he spent in cleaning and adjusting the machine, for he considers it necessary to keep a machine in proper trim. Oiling, adjusting and cleaning on the average took 1½ hours per 100 miles, or 97 hours for the distance traveled. Delays on account of punctures and other repairs totaled 17½ hours.

Adams Express Company Installing Electric Trucks

The Adams Express Company, in Indianapolis, Ind., has entirely discarded horses and wagons in that city, having replaced them by electric vehicles. The company has been gradually installing similar vehicles in all the larger cities in the East. At Indianapolis sixteen one-ton delivery and three two-ton trucks were put into operation about two months ago, and have been giving thoro satisfaction. The horse equipment abandoned included 32 horses and 22 wagons. These were maintained at a monthly cost of $600 exclusive of drivers' wages. The men who formerly drove the wagons have all been retained and trained to handle the new vehicles, receiving as pay for their work sums varying from $50 to $55 per month. The light machines travel at a rate of 10 miles per hour, and the heavier cars at 9 miles per hour. One battery charge is sufficient for 35 miles of travel for each class of vehicles.

Fifty thousand dollars, it is stated, was expended by the company for the installation of the motor wagon service. Forty thousand was expended for the vehicles and the rest went for the erection and equipment of a garage. The building is one story high 50 feet wide and 117 feet long, and has a capacity for 21 one-ton trucks and 18 two-ton machines. The garage is divided into three parts, the main wagon room, a storage room, and a repair shop.

Taximeter Cabs in New York

Two companies are at present operating taximeter cabs in New York City, the New York Transportation Company and the New York Taxicab Co. The former company has been operating its cars since the middle of July, and the latter company only started its service the first of October, and will increase the service as fast as deliveries of the motor cabs can be secured from Europe. Up to October 1, thirty of the Delahaye landaulets were received from the manufacturers, the Societe des Automobiles Delahaye, of Paris. The cabs have a very striking appearance, having deep yellow running gears, olive green bodies and black leather top and upholstering. The cabs are delivered without tires and are fitted in America with Goodrich tires. The cabs are all fitted with taximeters. For the first half mile or fraction thereof 30 cents is charged, each quarter of a mile thereafter 10 cents, and ten cents for every six minutes of waiting.

Ringling Bros., the circus proprietors, are using "Indestructible" steel wheels, made by Indestructible Steel Wheel Co., 1301 Michigan avenue, Chicago, Ill., on an automobile that is used in a somersault act in their show. In this performance the car attains a speed of 42 miles per hour, turns a somersault in mid air, drops 30 feet and lands with an impact equal to the pressure of 9000 pounds dead weight. This has been done twice daily thruout the season without damage to the wheels.

The Chase Motor Truck Company has recently acquired the plant formerly owned by the Sweet Steel Company, located at 310-334 S. West street, Syracuse, N. Y. This property covers a ground area of 50,000 square feet, or nearly an entire city block. Beside the office building on West street, there is a Machine Shop Building four stories, 17,280 square feet floor space; an erecting shop one story, 15,750 square feet, and the pleasure car department, one story, 21,600 square feet.

Thru a misunderstanding of the circumstances we stated in the November Journal, page 286, in referring to the Hewitt 5-ton truck that it had recently made a run from New York to Philadelphia at a rate of 14 miles per hour. As a matter of fact the speed was just about half this rate, as the trip, which is approximately 100 miles, was made in 14 hours. The manufacturer of the truck, Hewitt Motor Co., 6-10 E. Thirty-first street, New York City, makes a point of the fact that the truck is geared low, and high speeds are not possible.

The Sampson Gas-Electric Road Train

HUGH DOLNAR.

The Alden-Sampson Manufacturing Co., Pittsfield, Mass., U. S. A., showed at Madison Square Garden, November, 1907, a "Gas-Electric Road Train," consisting of a Tractor and two trailers. Each trailer has two electric motors, 20 amperes each, so that each trailer, weight 7,000 pounds, paying load, maximum, 14,000 pounds, 21,000 pounds total, can drive itself when its motors are supplied with electric current, at 5 miles an hour on a fair road. The Trailers are not equipt with an independent steering device, but when coupled into a train behind the Tractor they follow the course pursued by it perfectly. The Tractor and each trailer are mounted at each end and on two carrying and two steering wheels, not driven, and each is provided with two driving wheels, placed half-way between the carrying and steering wheels of each vehicle. The wheel base is the same thruout, 144 inches, the steering wheels are 42 inches diameter, with special wrought iron tires 3½ inches wide. The driving wheels are all 54 inches diameter with wrought iron tires, 7 inches wide. The gage is 72 inches.

The Tractor and Trailer wheels, springs and chassis frames are all alike, save that the Tractor is fitted with a spring-suspended, motive-assembly frame, and a steering gear, but save for the motive plant and steering mechanism the tractor chassis frame is the same as that of the trailers.

There are four equalizing springs under each car; these springs are 72 inches long, 3½ inches wide, 11 leaves, ½ inch thick, tongued and grooved. These springs are pivoted in the middle, are placed parallel to each other in front and near pairs, and each have one end resting in a cage on one of the end axles and the other end resting on one driving wheel axle. The middle of each spring is jointed to a chassis frame bracket, and each spring end is retained sidewise in a cage fixt to an axle, but is free to move endwise. Six struts under each chassis frame keep the three axles in about the same horizontal positions with respect to each other while permitting each wheel to lift or drop independently 15 inches, while each of the six wheels of any car in the train will always support the load upon the car, no matter how much any one wheel drops or rises.

The steering is thru bell-cranks pivoted to the middle of each front and rear axle and linked diagonally to each other; the short arms of these bell-cranks are 14 inches long, disposed cross-wise of the car, and the long arms are about 84 inches long, with slotted ends to take studs under the rear end of the next car forward. The cars are coupled together by tubular draw-bars, 54 inches pin hole to pin hole, with ends welded in and fitted to 1⅛ inch coupling pins. The effect of this draw-bar coupling and the steering bell-cranks is to make all the wheels of a train of any number of cars follow the tractor wheel tracks exactly.

Each driver has a sprocket 28 inches pitch diameter to take a 1¾ inch. pitch chain, and the sprocket is bolted to a malleable iron brake-drum, 22 inches inside diameter by 3½ inches face. The brake shoes are steel castings, jointed, and toggle expanded, and each shoe carries a segment of oakwood forced against the inside of the brake-drum when applied by a hand-wheel thru an equalizing bar. The electric motors serve as brakes by control from a tractor.

The Sampson Gasoline Electric Road Train: The tractor has a generating plant consisting of a 4-cylinder motor with a silent chain drive to a 35 K. W. dynamo. The motor cylinders are 6½x7 inches, 4-cycle, water-cooled, jump spark ignition, and show 50 B. H. P. at 650 R. P. M. All power is transformed to electric current, which is wired to two independent motors on the tractor axle on each trailer of the train, avoiding the use of balance gears. The steering is by a worm and worm gear sector, with an 18-inch hand-wheel. Weights, dimensions, power and price will vary to suit conditions of service.

The tractor has a generating plant consisting of a 4-cylinder motor with a silent chain drive to a 35 K. W. dynamo. The motor cylinders are 6½x7 inches, 4-cycle, water cooled, jump spark ignition, and show 50 B. H. P. at 650 R. P. M.

All power is transformed to electric current which is wired to two independent motors on the tractor and on each trailer of the train, avoiding the use of balance gears. The steering is by a worm and worm gear sector, with an 18 inch hand-wheel. The axles are I-section steel forgings. All wheels are on steel axles with bronze hub bushes.

This road train can be made to carry any load desired, as the trains can be of any length, and the motor can be given any power needful. Weights, dimensions, power and price will vary to suit conditions of service. The train described is designed to meet general requirements.

An automobile bus service is to be organized between Aiken and Wagener, S. C. Cars capable of carrying twenty-five passengers and freight will be used.

1908 DELIVERY CAR

MODEL D. C., 4 H. P., $550; 8 H. P. $650

Fitchburg, Mass., Sept. 25, 1907.

WALTHAM MANUFACTURING CO.,
Waltham, Mass.

Gentlemen:

Perhaps you may care to hear of a trip that I made July 4th to demonstrate the good qu ities of my Delivery Car—Model DC 4-HP.

There is a young man here who has been talking of buying one to use on a poultry far He had called upon me twice and I had called on him some six or eight times, and I felt ve sure that if I could make a good demonstration, I could make a sale, so I agreed to meet him ten o'clock, July 4th, and we would go up to his farm which is about eight miles out from t city. I met him as agreed, and as he had a friend with him I had nearly 200 pounds extra los The combined weight of us three was 545 pounds. For the first five miles I was well acquaint with the road; then we turned on to a road that I had never been over and for three miles I dro my car over the roughest and worst road that I ever want to see. There were places where gra had covered the entire width of the road and other places where one side was washed out; the were deep gullies across the road; there were places where the brush was so close that the fen ers on each side of car would hit. It was a steady ascent with no very steep grades but one th called for very careful driving.

At last I caught a glimpse of a house through the trees and began to feel better, but ju before we reached the house there was a sharp turn in the road and all that we had passed w but play to what was before us.

We were at the foot of a hill some five rods long, covered with small pebbles and it was t steepest grade that I ever remember riding over, either with team or auto. But my faith in t little motor was strong and I started; about one-third of the way up I thought what if somethi should break—I would be in a fix—so I stopped and asked one man to get off and walk behind wh a big rail to block the wheels in case of an accident to brake or power. But nothing happen and we reached the top in safety, and I want to say right here that I made a standing start on t steep hill and reached the top as quick—if not a good deal quicker—than a horse could, and t friction transmission did not slip.

That was the worst hill on the trip for the rest was easy. I stopped and waited for the m to come up, looked the machine all over; oiled up; and soon reached our destination.

When we were ready to return I asked if there was another road home. He said "Oh, ye go about half a mile and we would have State Road all the way home.

I have run my car over 3000 miles and the friction is in fine condition yet. All the troubl have had has been in the tires. Nails and glass bottles are bad for rubber.

Yours very truly,
W. A. YALE.

Waltham Manufacturing Company

ne Commercial Motor Truck Company, ter of the Plymouth cars, Plymouth, o, U. S. A., will offer a single model hassis, fitted with either a truck plat- n or a "sight-seeing" body, for the sea- of 1908. The paying load capacity is pounds, and the distinctive feature ne Plymouth car is the double variable- d friction drive.

ne Commercial Motor Truck Company organized in 1906, and its factory was ted in Toledo, Ohio. Plymouth capi- became interested, with the result that ew brick factory building was erected Plymouth, and occupied in November, . At the time of the removal from do to Plymouth, there was but one erimental friction-driven Plymouth k in existence. Experiments with first chassis were pursued to March,

The Plymouth car's friction-drive new in form. The aluminum disks an paper wheels, as first used about 190 being arranged in this instance so as t balance the thrusts of two paper wheel on either one of two aluminum disks, on disk or the other being prest against th two paper wheels according to the dire tion of the truck-travel desired, so tha the paper wheel pressure is the same o each side of the working aluminum dri ing-disk.

This arrangement of two paper wheel which may be equally moved towards th disk center or away from it, balances th thrusts on the disk and also doubles th power transmitting capacity of a disk an paper wheel drive of given dimension The balanced thrust avoids the heavy sid friction inseparable from the single tra

Fig. 1. The Plymouth 1908 friction driven truck, 4000 pounds paying load; wheel base, 103 nes; gage, 56 inches; tires, front 34x3½ inches, rear 36x2½ inches, "dual." All tires solid. The or is 4-cylinder, 4¾x5 inches, 4-cycle, water-cooled, nominal 40 H. P. Double friction drive n 1¼-inch pitch Whitney roller chain to the rear wheels. Weight, 3800 pounds scale. Price, 0, including 3 oil lamps, horn and tools, ready for the road. The regular body is here shown. form of body to order, price as agreed.

with no conclusive results, and in month a change was effected, which e Walter C. Guilder, formerly with Pope Toledo Company, supervising neer for the Commercial Truck Com- . The 2-ton, friction-drive truck, here described and illustrated, has been uced under the direction of Mr. Guild- who has been actively connected with r car design and construction for the four years.

FRICTION DRIVING FOR TRUCKS.

e friction-drive, which was a failure ne most discouraging description in

versing paper wheel and friction disk which is one great gain, while the use o two paper wheels imposes only half th work on each one that would be carrie if only one paper wheel was required t transmit the same power, which is a sec ond great advantage.

Since the paper wheels are moved equal ly and simultaneously to or from the disk center, the pressure on the two sides o the disks is the same, and as two disk are used, one for the forward drive and on for reversing, the work is perfectl balanced, and is also divided so that eac

g friction surfaces. This does not ar to be a self-evident proposition,

2. Front view of the Plymouth Truck, ng the front axle construction and the large ng pivots; also the method of mounting the s by long encircling clips, and the mount- the radiator on the front cross member of ame.

n the opinion of the writer it has rtheless been fully proved to be true emonstrations made with over-loaded s rounding short radius curves on roads, with no perceptible waste of r, and with no call for added motive .

e Plymouth balanced friction disc does all that can be done in truck ng by any sliding gear arrangement, does it with a degree of silence and inty which no arrangement of ed gearing has ever yet shown, thus

backward drive. This was changed by Mr. Guilder to a fixt position counter-shaft carrying the traversing paper wheels and two driving disks fixt to a shaft, which has a short movement fore and aft by a linkage of plain levers and latched pedals, one pedal for the forward movement and one for the reverse. The pedal ratchet teeth are closely spaced, and the pedal is simply pushed forward until the friction drives the car. The speed change is by a vertical outside latched lever at the driver's left hand, which traverses the paper wheels equally thru a two-armed rocker and two bell-cranks.

The whole control is most simple, plain levers, locked by lever and pedal latches. The construction is so plainly shown by Figs. 6 and 7 as to need no detailed description.

In Fig. 1 is shown the 1908 friction-driven truck, 4000 pounds, paying load. The wheel base is 103 inches; gage, 56 inches; tires, front 34x3½ inches, rear 36x 2½ inches, "dual." All the tires are solid, the dual 2½-inch tire being two 2½-inch face convex treads integral with a single base, this integral base being 5 inches wide. This Firestone solid "dual" 2½-inch tire carries 900 pounds more than a 4-inch single Firestone tire. The front tires cost $84.00 per pair. The rear tires cost $124.00 per pair. The motor is four-cylin-

Fig. 3. Side view of the 1908 Plymouth Truck Chassis. This view shows the location of the inder motor and the friction change speed gear. Two friction wheels are used at once ist the forward or backing disc, as the case may be, each wheel driving one of the rear s thru a chain. The motion of one of the friction wheels is reversed by gears before it

The COUPLE-GEAR ELECTRIC-TRUCK

Motors Contained in the Wheels
Single Reduction of 25 to One

The Wonderful Efficiency Of This New Mechanical Means Has Been a Revelation to Students of Transmission.

The Power is applied to both sides of the wheel at the rim and the wheel is turned in the same manner as you wind a watch with the thumb and finger. (The principle involved is known in mechanics as "Couple-Action," from whence we take our name.)

The Entire energy of the Motor is converted into useful propelling force, giving the **Couple-Gear Truck Ample Mileage** for every condition of service. (The mechanical transmission efficiency exceeds 97% at normal load for the motors.)

Five Ton Trucks, Driven and Steered by **All Four Wheels,** Operate equally as well in either direction.

One and Two Ton Trucks, Front Wheel Drive and Steer. Rear wheels large diameter with steel tires or 36-inch Dummy wheels with rubber tires.

NOTABLE FEATURES.

side of the double friction drive, the iar features of the Plymouth truck placing of the driver and the control e left side, as is correct with our ican "turn to the right" rule of the as it seats the driver on the side of ar nearest the passing vehicle, so he can see what is in his way best. car is very strongly built thruout, he control is simple, strong and con- nt, with no delicate parts and noth- nywhere that is liable to disarrange-

BRAKES.

These are internal only, in rear hub drums, which are steel castings integral with the 54-tooth sprockets. The brake drum inside diameter is 16 inches by 2½ inches face. The jointed steel casting shoes are Gandy belting faced, cam-rocker expanded, and are applied thru a long evener, all the way across the chassis frame, and a brake pedal, which is latched.

The friction drive furnishes a powerful reserve or emergency brake, which can be applied without detrimental wear. The rear hub brake is 16 inches in diameter, and will hold the car anywhere.

Fig. 4. Plymouth Truck. This view shows the control levers, the pedals working in long l segments, two being ratchet retained. The double wheeled friction change speed and the platform spring arrangement.

THE AXLES.

e front axle is by Timken, of I-sec- with the load carried on Timken ngs at the top of the stub axle pins. front wheels have Timken hubs and ngs. The rear axle is a 2½-inch e, steel forging, and the rear wheels n Timken rollers.

SPRINGS.

front springs are half-elliptic, 38 s long by 2¼ inches wide, 9 leaves, ed and grooved, no bands, jointed to hassis frame in front and linked in ear. The rear springs are platform side numbers 40 inches long and 2¼ s wide, 10 leaves. The cross mem- 34 inches long and 2¼ inches wide, ves, shackled to the side spring rear and fixt on top to a wooden hols- The front ends of the side springs nked to the chassis frame.

struts are revolubly mounted on the are screw adjusted for length and

CONTROL.

The single outside hand lever at the driver's left, shifts the paper wheels and changes the speed. There are three pedals in long segments on the foot board; the left-hand pedal, latched, applies the rear hub-drum internal brake shoes. The middle pedal free, effects the reverse; the right pedal, latched, is pushed forward to obtain the forward drive. The steering post is vertical and the spark and throttle levers are ratchet retained on top of the hand wheel.

ON THE ROAD.

Monday, October 21, a Plymouth truck, loaded with 3000 pounds of pig iron, which was weighed in presence of the writer, left the Plymouth shops with four persons aboard, making the total load about 3700 pounds. The designer of the truck W. C. Guilder was at the wheel,

and life seemed really delightful as eaded over the hills for Shelby, some 15 miles or more away. The roads clay and gravel, more often clay, in one place were broken stone, fresh-id and not rolled down at all. There been recent rain, and the clay road slithery in spots, especially on north ides. We found, however, that the put the solid tires down to hard bot-and climbed several hills in good form were surmounting the steepest and est one between Plymouth and Shelby

that 5000 pounds of pig iron, and the loaded it on again after the truck once more stood astride of the back-bone of that yellow clay hill-side pike.

The adventure of the fresh laid broken stone was not quite so thrilling, tho we stopt dead in the middle of the 100-foot stretch of new road-making and the rear wheels of the truck dug right down thru the loose stone as they whirled vainly round and round while the crew looked anxiously at the pig-iron cargo. This time however, fence boards saved us, and we

Fig. 5. Plan and elevation of the Plymouth friction change speed mechanism. Two mov- discs one for forward and the other for backing are provided. Two friction wheels, both of ch engage either one or the other disc at points at diametrically opposite sides of the disc's ter, are arranged as usual to shift across the face of the disc, but keep equally distant from center, thus sharing the transmitting of the load and obviating the tremendous bending move-t caused by the use of only one friction wheel.

nphantly, when the designer-driver ed to the observer with an exultant rk and turned the wheel as he turned head. The pike was narrow, high in middle, with a deep ditch on the right the surface was wet, yellow clay. The of the wheel was just enough to start ruck to sliding sidewise into the deep next to the high trolley track, and e it stayed in spite of all expedients, soon afterward struck hard roads and made a racing clip of 15 miles an hour into Shelby, where the observer caught a New York train.

The Plymouth truck has power and plenty of speed, which is of course a great advantage, and can do hard work much more easily and cheaply than horses can as many Plymouth truck purchasers can testify.

offering several new types of body re, in fact, prepared to meet prac- any requirement in 3 and 5-ton . One of the new body designs e illustrated and any can be had on the 3 or 5-ton chassis. The platform sions of the smaller cars is 5x12 feet, f the larger ones, 6x13 feet.

1908 improvements consist of sim- g the construction, making better ion for lubrication, increasing wear- rfaces, increasing cooling surface of diators and the use of dual tread n the rear wheels.

is of air tight design to insure against sparking.

The high speed clutch is of the disk type and alternating steel and hard bronze plates are now used. The transmission gear case is so arranged that a supply of oil is retained at all times. Slow speed ahead and reverse brought into operation by wide faced fiber lined cast steel brake bands. All gears in transmission have ample face, run on bronze bushings and pins with careful provision made for ample and constant lubrication. Gears are case hardened where necessary and made of nickel steel.

American Express Body Wagon.

piston end of the connecting rod is l with hardened and ground remov- steel bushings giving extra large g surface. Crank ends are bushed emovable babbitted bronze bushings d to fit shaft and supplied with oil grooves. Special arrangement e for ample lubrication at both ends connecting rod.

crank shaft is of the best ham- high carbon machinery steel, oil l, machined all over and ground to Five bearings of unusual length and er support the crank shaft.

cam shaft is of high-grade nery steel supported by four bear- ith removable bearing caps. These able caps allow cam shaft to be re- without disturbing position or ng of any cams. All cams are to correct contour and hardened.

Two brake drums are provided on jack shaft. Brake bands are of cast steel fiber lined, adjustable for wear. Emergency brakes are placed inside of the rear sprocket drums, arranged to take up for wear. The 1908 machines are also supplied with two drag bars to be used on hills when thru carelessness the regular brakes are not in proper adjustment.

The frame is now made of heavy steel channels, hot riveted, securely braced by cross members and gusset plates. Front end is protected by a cast steel bumper of ribbed section. Semi-elliptic springs are used.

Each machine is equipt with two front light and one tail light, horn, complete, and a full set of wrenches and tools.

Bodies are built by expert wagon makers, carefully ironed, and constructed of the very best seasoned lumber. Any

The fuel and battery tank is another feature of the 1908 Light, being designed to contain the fuel, oil and battery without being bulky and in the way, and having

The Light one to three gear drive. A is the fly-wheel on which is the small gear C. B is an internal gear on a small disc which meshes with the gear C and this disc also forms the cover for the gear.

the battery easily accessible for inspection or replacement. The cells are rigidly held to a removable board by means of steel bands. The board is held in place by long bolts (A) and secured by a clamp (B).

The gasoline tank of the Light motor cycle, showing the battery compartment with the batteries removed. The batteries are securely held to the removable board by steel bands. The board is then slid into place on long steel bolts A, afterwards secured by Clamp B.

A Sager spring fork is fitted to Model A at extra cost but is included as regular equipment on Models B and C.

The grips are made of fabric and rubber, and are 10 inches long, the ends extending beyond the handle bar ends. This arrangement gives a flexible hold similar to the effect of a spring handle bar.

The other improvements may be summarized as follows: Improvement of valve mechanism; 30 per cent. increase of crank pin bearing surface; 15 per cent. increase of wrist pin bearing surface; increased oil space in the base; better position of the motor, giving more exposed cooling surface, and independent adjustment of the power chain and pedalling chain.

Model A lists at $185; Model B at $225, and Model C price is not yet announced as deliveries will not commence till spring.

Putnam 1908 Cycle Motors

Putnam Motor Manufacturing Co., 57 Lebanon street, Springfield, Mass., is continuing for 1908 its 2¼ and 4½ H. P. single and double cylinder cycle motors, weighing 30 and 55 pounds respectively. No radical changes have been made in these motors for this season, but the cylinders are now finished by lapping, which process the company considers best, tho costing most. The list prices for 1908 are $50 for the 2¼ H. P. motor, and $85 for the 4½ H. P. model. In this motor the exhaust valves are operated by push rods and rocker arms, while the intakes are as usual suction operated. Three rings are fitted to the piston, and the wrist pins are positively held in place so that scoring of the cylinder is impossible from that source. The connecting rods are of bronze and have large bearings at both ends. The cranks are made from special crank shaft steel, heavy enough to carry a full load without springing.

The new motorcycle club organized in Washington, D. C., has adopted the title of Columbia Motorcycle Club.

The directory of automobile, motor boat, motorcycle, part and accessory manufacturers which constitutes the most important feature of the January Journal is the most accurate of its kind, and from no other source can you obtain one so complete. Subscribers to the Journal are sure to obtain a copy, as no extra charge is made for this important number. Non-subscribers should, however, remit at once if they desire to have their subscriptions commence with the January number. The yearly subscription rate is $2.00. Single copies of the January number can be had at 20 cents each, same as any other number.

e 1908 Yale-California Motorcycle; driven by a 2¾x3¼ inch, 2¼ H. P. motor. Price $200; weight bs.

The 1908 Yale-California

s popular and efficient motorcycle, by Consolidated Manufacturing Co., o, Ohio, shows no radical changes 908, as only detail refinements were necessary. The power of the motor

used on the 1908 Yale-California Motorcycle

been increased from 2 to 2¼ horse

facturing Company, and is the Sager type. It is fitting to remark here that every part of this machine is made in the Consolidated Company's factory, no parts being purchased outside. The 1908 fork is made of ⅞-inch, 10 gage tubing, with forged tips, and the bolts and bushings are all hardened.

The battery box has been transferred from under the saddle to the lower side of the rear fork between it and the seat mast, while the coil case is now placed in front of the seat mast instead of back of it. The battery box was moved to allow the use of a large coil spring saddle, which the former arrangement did not permit.

A peculiar feature of the Yale-California drive is the lagging of the engine pulley with hard cord to prevent belt slipping. The belt is made of two plies of specially tanned, water-proof leather.

In the advertisement of The Consolidated Manufacturing Co., Toledo, O., on page 293, November Journal, the 1908 model of the Yale-California motorcycle was mentioned, while the cut price and text referred to the 1907 model.

The weight of the 1908 machine has been slightly increased, being now 120 pounds, and the price is advanced from $185 to $200.

An adjourned meeting of the Cycle Manufacturers' Association will be held at Chicago, Wednesday, December 4, the meeting of November 7 not having a quorum present.

as an entirely new system of tension
iation which operates from the seat,
by which the belt is given proper
ion without exerting pressure on the
ings, or even making it necessary to
ner-face the front pulley.
a result of the special belt treat-
t and tension regulator, the belt can
lipped in traffic for very slow speed,
to allow the engine to gain speed on
l; also for free engine effect.

Motor of the "Excelsior" Motorcycle.

e belts are stretched thoroly before
are fitted, and after treatment they
ch so little that splicing is said to be
necessary for thousands of miles.
e rear frame slots are extra long, al-
g three extra links to be put in the
ng chain, thus taking up the belt
. The design of the frame gives a
long belt, which adds greatly to its
nd service.

FRAME AND FORK.

e frame head is specially designed
ace the bearings far apart, relieving
train, and is drilled out of a solid

various methods of construction, and
made to take care of the small inequal
ties of the road as well as the most sever
shock, by a carefully worked out metho
of springing. The joints have bearin
surface enough to stand the constant wea
of fork action. This fork has proven suc
a decided advantage that it is included a
a part of the regular equipment.

The case containing the dry cells an
spark coil is so located as to bring thei
weight very low. This case also has
compartment for tools and extra parts
which is supplied with a special tool ro
containing large wrench and adjustabl
spanner, small wrench, combination plier
and wire cutter, screw driver, oil can, tir
repair kit pulley remover, pump, extr
spark plug, extra chain links, wire an
sand paper. On the inside of the doo
are full directions for care and use of th
machine.

THE TANKS.

The gasoline and oil tanks are of heav
copper. The filler holes are large enoug
to take the usual large garage funnel, an
provided with removable strainers. Th
oil regulation and gasoline valves are di
rectly in front of the rider on top of th
tank, within easy reach. A special gaso
line filter is fitted to eliminate carbureto
trouble. This filter is cleaned by simpl
opening a stop cock.

The capacity for gasoline is two gallons
The oil supply is sufficient for five or si
hundred miles.

The position of the rider both for com
fort and balance, as well as effective roa
riding, has been carefully studied. Th
saddle is very low, placing the rider with
in easy reach of the ground, and yet th
pedals are located far enough forward an
low enough to give the feet and legs a
comfortable position. The cranks are
short and pedal gear very low to obviate
the spreadout foot position which long
cranks give, but not affecting easy start-
ing.

LUBRICATION.

The oiling system is a radical departure
from the usual custom, being by sight
(drop) feed to the main bearings from
which the oil enters the case to be
splashed into the cylinder.

The fly-wheels are made to act as a
centrifugal pump which regulates the flow
of oil on all average speeds. By giving
the main bearings clean oil, their life is
greatly lengthened. All engine oiling is
taken care of from one sight-feed glass.

The Indian to the Front as Usual

At the Chicago Show Nov. 30 to Dec. 7 will be found on Exhibition 1908 INDIANS consisting of

2¾ H. P., Single Cylinder - Price $200.00
3½ H. P., Single Cylinder - Price $225.00
5 H. P., Twin Cylinder - Price $250.00

All Equipped with Mechanically Operated Inlet Valves

New Features

Mechanically operated inlet valves
Increased horse power
Improved G & J Tires
Standard No. 3 Motorcycle Pedals
More spring to Cushion Fork
Gasoline shut-off, operating with needle valve

Options

Gear or Chain Drive
Battery Case to take Standard Dry Cells
Magneto Ignition, $40 extra
Brooks B-100, B-104, B-90-4 Saddles
Blue, black or Indian red

The 5 H. P. Twin Indian is the masterpiece of Oscar Hedstrom, two powerful cylinders, exerting constant tension on the driving mechanism, using only minimum power for regular road work, and reserving tremendous power for bursts of speed and triumphant hill climbing.

M. M. Special for 1908

THE REAL M. M. FOR 1908

is truly the greatest Motor Cycle value in the World. Think of a 140 lb. 3½ H. P. Motor Cycle, equipped with 26″ wheels, nickeled rims fitted with 2¼″ G & J double tires, newly designed cylinder and cylinder head doing away with any chance of engine over heating or causing ring trouble; special frame dropped 2″ at seat post joint, thus bringing the top of saddle in a direct line with top of frame; slightly more rakish at front or head, thus bringing handle bar back a little nearer the seat, at the same time giving machine a longer wheel base, which is a decided advantage in Motor Cycle construction.

ALSO EQUIPPED WITH THE PATENT M. M. TRIPLE PLATE SPRING FORKS, a very old idea in springs worked out to the highest point of efficiency with brand new ideas in the application to Motor Cycle building, used exclusively and only on the M. M. for 1908.

A new chain idler device, which together with the long rear adjusting jaws admit of a longer wheel adjustment, thereby taking up any and all slack that might appear in belt, doing away with belt idler and adding efficiency to the belt transmission; the belt detachable through rear stay by simply removing one bolt.

Attached to rear frame is a patent Motor Stand, ready to hold your machine at a moment's notice. On tank will be found priming device in direct contact with cupped pet cock on cylinder head, allowing of the priming of cylinder when machine is hard to start, by simply pressing a button.

Don't you think such a machine would sell in your section?

KOKOMO RUBBER CO

nated by making provision for adjusting the tension of the belt at the rear end of the rear fork, same as in pedal cycle chain adjustment. The slot in the end of the fork in which the rear wheel axle is held, is extra long and allows for plenty of rear wheel adjustment to take up the slack in the belt. In connection with this scheme a chain idler is used to take up chain slack. A new, light, compact stand is a

M. M. tank cap fastening.

End of Muffler of the M. M. Motorcycle showing cut-out lever (A) and deflector plate (B).

part of this model. It is hinged to the rear wheel axle ends, and when not in use is securely held at its rear end to the mud guard. It can be brought into use in a few seconds. The rear frame construction is such that the endless belt can be removed by simply taking out one bolt. The rear mud guard is detachable at the

Piston of the M. M. Cycle Motor showing ring over the wrist pin.

M. M. Rear Fork end showing method of adjusting the chain and belt tension.

frame to allow quick access to the tire for repairing or quick removal of the rear wheel. The frame is dropt two inches at the seat cluster to give a low saddle position.

The new cylinder is turned from solid stock with deep flanges, which pass entirely around the cylinder head bolts. The new head is constructed to cause the exhaust gases to pass up and out with an effect similar to that obtained by having the valves in the head. The areas of the valve ports have been increased. The piston is fitted with an extra ring passing over the wrist pin to prevent its working out and damaging the walls of the cylinder, and eliminate the necessity for set screws or similar holding devices for the pin.

The muffler is provided with a cut-out operated by a lever, which is actuated by the rider's foot. This lever is marked A in the accompanying illustration. As the exhaust leaves the muffler it strikes a deflection plate (B), and is thus deflected at right angles instead of going straight down and stirring up the dust in the road.

The 100 pound model, listing at $140, is catalogued as Model G, and is fitted with a 2¼ H. P. motor, vertically placed in the frame. Its wheel base is 53 inches, and its 26-inch wheels are fitted with Palmer tires.

The 2-cylinder model has a 6 H. P. motor with the cylinders set at an angle of 90 degrees. The cylinder bore is 3¼ inches and the stroke 3¾ inches. Twenty-six inch wheels are used on this model, and 2¼ G & J or Goodrich tires. The wheel base is 56 inches and the frame is 20 inches high. As will be seen by reference to the line drawing herewith the crank hanger can be set at different positions by means of a turn buckle to allow for adjusting the chain tension. An M M double jet carburetor is used, and has separate adjustment for each cylinder. The gear ratio on this model is 3 to 1, and speeds up to 65 miles per hour are said to be attainable. A double priming device is fitted to this model. Price is $250. Drive on all these machines is by 1¾-inch flat, mineral tanned belts.

openings in the intake valve, which are uncovered by turning the right grip. The detail drawing herewith plainly illustrates this feature. The left grip controls the spark.

Another clever feature of the 1908 Merkel is the commutator, details of which are here illustrated. This commutator is so arranged that it can be quickly removed by simply turning to one side a

1908 Merkel Oil Reservoir in the crank case, surrounding the bearings.

blade spring as seen in the accompanying illustration.

Provision is made on the new model for the fitting of a magneto if this is preferred to battery and coil. If magneto ignition is desired, a Simms-Bosch magneto is fitted at an extra cost of $40. In such case the commutator is removed and a sprocket placed on the commutator shaft from which motion is transmitted to the sprocket on the magneto shaft by a chain. This change can be made on any Merkel motorcycle in a half hour. A small sup-

The Merkel Relief Valve for easy starting.

port is attached to the crank case to hold the magneto, and only 18 inches of roller chain is required to connect the sprockets for driving the magneto.

A combination tank is used, in which gasoline, oil and battery are all carried. The battery compartment is of tubular form, about equal in circumference to that of the average dry cell. The cells are placed end to end with coil springs between them and a rubber buffer at the end to prevent their being knocked about in the compartment.

Power is transmitted by means of a 1½-inch, 2-ply flat belt made of special chrome tan leather, same as has been used with satisfaction the past two seasons, but a

Merkel Gasoline Tank and Battery Compartment.

new idler is a feature of this model. This idler is adjustable, so that the tension of the belt can be regulated by the rider while the machine is in motion. The idler can be raised or lowered by means of a vertical rod, the handle on top of which is within easy reach of the rider. This rod is notched at intervals, as shown in the sectional view, to admit a correspond-

THOMAS AUTO-BI MOTORCYCLES

Answers to Motor Cycle Queries

BY CHAS. H. METZ.

SALESMAN CONTEMPLATES USING MOTORCYCLE

Worcester, Mass., Oct. 13, 1907.

I am considering the advisability of using a motorcycle to travel over a certain territory showing up a cement machine of which I have the agency. I cover the New England States calling on contractors and builders, and in a general way cover every town of 2000 inhabitants or over. The model which I carry weighs 21 pounds, and is contained in a box the outside dimensions of which are 12 inches wide, 4 inches deep and 16 inches long. Besides this, I have a hand bag to carry necessary change of clothing and toilet articles. Weight 13 pounds. My weight is 160 pounds.

I have been using an automobile, a four-cylinder runabout 15 horse power since last April 14th, and up to date nave covered 6453 miles. While I realize that the auto is a good investment I am a little disappointed in the running cost for I find this is greater than I anticipated.

As a basis of figuring I will give you the items of cost so they can be compared with the motorcycle, the running cost of which I would like to have you inform me, if you think it feasible for my business. I have been told that a motorcycle cannot be used on muddy roads. Please inform me as to this for I shall have to take into consideration the time lost for any cause.

I hope you will be able to give me figures for comparison in the various items, also an unprejudiced opinion as to the practicability of the motorcycle for my purpose.—J. E. B.

Your items of expense agree very closely with observations I have made on a car of about the same cost and power. I figured a trifle over 7c per mile, but the average condition of roads over which I traveled was probably somewhat better, and I did not include the cost of garage or stable as I housed my machine in my own barn. To be correct the rent of the stable and the extra cost of insurance should have been taken into account. There is not the slightest question as to the practicability of the motorcycle for your purpose. A carrier suitable for your

sample box and hand bag is regularly made, and we herewith illustrate the method of attaching. A run of 60 to 75 miles per day is really no task for any man; many riders have frequently made over 200 miles in a day.

Taking up first the cost of motorcycle, depreciation, and cost to operate. A first-class machine fully equipt with luggage carrier and stand together with necessary accessories would cost $200.

Allowing a depreciation for one season of 25 per cent. (which is ample)	$50.00
108 gals. Gasoline (60 miles per gal., at 22c)	23.76
4 gals. Cylinder oil (400 miles per qt., at 75c)	3.00
1 New outer shoe for rear wheel, (rear will wear 5,000, front 10,000 miles)	10.00
Express on tire	.35
Supplies, (Estimated)	1.00
Repair and replacement (Estimated)	10.00
Batteries 8 sets of 3, at 75c	6.00
Interest on investment $200, 6 mos., at 3 per cent	6.00
Total cost	$110.11

or 1 7-10 cents per mile.

According to the above figures, which I consider on a conservative basis, you would actually save $30.00 over your railroad fares.

In comparing the speed at which it is safe to run an automobile and motorcycle over the average road I find the advantage to be in favor of the motorcycle. On runs where I have averaged 18 miles per hour on the auto, I have done 20 comfortably on the motorcycle, so it would be fair to concede a 10 per cent. advantage in speed for the motorcycle. I think I am underestimating this but I have in mind your caution for an unbiased opinion so I will not take advantage of any doubt.

Figuring, therefore, that the motorcycle is 10 per cent. faster you would be able to cover the same territory in 2½ weeks less time, and there would also be a saving in time for cleaning and adjusting which need not be at the most, more than one hour for each 100 miles traveled, or 64½ hours total time, a saving of another half week. We will estimate the delays for puctures and repairs the same as your record, for that seems a short time for an auto, but is ample allowance for the motorcycle.

Now as to the advisability for using the machine in the mud and rain. I admit it is not altogether pleasant to drive in the rain, especially when unprovided with proper clothing for this purpose, and some kind of roads when the mud is in a certain state it is almost impossible to ride at all, so we will make ample allowance for such contingency and say that in 6 months we have 200 hours in which a motorcycle cannot be comfortably used on the road deducting 31 hours from this, the time in which your auto was stopped under this condition we have 169 hours in the 6 months in which the auto is useable when the motorcycle is hung up. This is equal to 2½ weeks, counting 10 hours per day, but since we had previously gained three weeks over the auto we are still one-half week ahead, but the 200 hours allowance for loafing would be well spent by traveling in the old way by train and trolley and at least one-half the business done that could be done by the auto in that time. So assuming a net profit of $1000 as a basis in 6 months by the original method of travel by rail. You have increased your sales and profit by auto traveling 35 per cent. or

	$350.00
Less excess of traveling cost of auto	240.00
A net gain in profit over the rail method	$110.00
Traveling by motorcycle we can cover 40 per cent. more territory, so increase our sales and profit	$400.00
Adding result of 10 days work by rail	66.00
Saving in hotel bills by covering territory in 9 weeks, less time	180.00
Saving by motorcycle travel, less than railroad	30.00
A net gain over the old method	$676.00
A net gain over the automobile method	566.00

METHODS OF DRIVING

Would it be practicable to make the proper reduction of gearing for a motorcycle by using the crypto or sun and planet transmission either at the motor crank shaft or in the rear wheel hub, with direct chain drive, and thus avoid the countershaft and extra sprocket and chain of the ordinary chain-driven machine; or the very small engine sprocket and very large rear wheel sprocket of the direct chain drive such as was used last year in the Metz, the Armac (as an option) and this year in the Torpedo?

2. Am I right in believing that the use of the last mentioned direct chain drive involved too much expenditure for chains and sprockets owing to the quick lengthening of chain and the very great wear of driving and driven sprockets?

3. Has the roller chain proven superior, in any marked degree, to the block chain as means of transmission for motorcycles?

I ask the last question because chain manufacturers have written me that they did not claim for their roller chain any less liability to lengthening—only a more agreeable action under adverse circumstances, such as mud, dust or rain. On the other hand, the R-S makers advertise that their tests have shown a very great superiority of the roller chain; and I believe that both you and the Armac makers claimed, last year, roller chains were going to obviate the difficulties mentioned in question 2. The English makers of the very finest roller chain I ever saw (the Hans Renold) wrote me (in reply to query why the ½-inch and ⅝-inch pitch chains were almost universally used in England) that they knew of no advantage of the ½-inch and ⅝-inch pitch, over 1-inch pitch except that perhaps the ½-inch and ⅝-inch, accumulated themselves to bending around small sprockets a little better than 1-inch pitch.)

They sent me a sample of the Hans Renold roller chain, 1-inch pitch, ⅛-inch width, and it certainly was way ahead of any American roller chain which I know of in lightness, in neatness, and I believe in construction. The rolls had not the slightest "play" in the rivets, or bushings I guess I should say, and yet each turned freely and every link bent freely. It may be unpatriotic to say this, but it is a fact. They mentioned a few cases where riders got 6,000 to 10,000 (I believe more) miles' use out of their roller chains. I have never been able to use any roller or block, or twin roller, 2,000 miles before they had lengthened badly.

Will you answer this question as well as you can? About what power motorcycle with efficient belt drive will equal in hill-climbing ability a chain-driven machine of 2¼ h. p., bearing in mind that the belt-driven is usually geared about 5 to 1, and one to chain-driven about 7 to 1? (Other factors in the problem being equal).—HENRY H. WHEELER.

It would be practicable to use either method you mention for reducing the gear ratio between driving, and driven shafts, but both these methods have disadvantages sufficient to prevent their use being entirely satisfactory.

The crypto or sun and planet form of gearing involves complication, noise and loss of power. If applied as you mention, for the sole purpose of reducing the size of the driven sprocket, they would not be as satisfactory as the countershaft (either chain or tooth gear) reduction now used on a number of machines. The planetary gear, however, lends itself to a two speed mechanism without much further complication, so with this additional feature it might prove itself preferable.

In the present state of the art the point on which the argument centers, is whether the direct chain drive with a small driving sprocket on a comparatively large driven sprocket is as good or a better device than the intermediate shaft reduction. On the direct drive we have the advantage of simplicity, lightness, cheapness and higher efficiency in power transmission, but the disadvantage of a shorter period of use from chain owing to the fact that the stretch of chain will assert itself to a greater degree on a very large driven sprocket than on one, say of half the size. On this type we have also the complication of a chain idler which detracts somewhat.

The countershaft meets the disadvantages of the direct drive to some extent, but does not eliminate them. When the short chain is used the driven sprocket permits of more chain stretch, but owing to the fact that the chain is shorter it wears out faster because each link passes around the sprocket oftener, and it is the oscilating movement thus imparted between rivet and block coupled with lack of lubrication and fine grit which destroys the bearing by grinding or cutting away the bearing surfaces of the joint.

The quality of the steel seems to have little effect on the life of the chain. Hardness is no preventative of wear if the lubricant gets mixt with fine grit, and it offers but slight resistance to cutting when the lubricant has been squeezed out.

The best service of a chain used on a direct drive machine that has come to my notice was one having a ⅝-inch pitch roller chain, 10 tooth on to a 60. This had driven the machine 1500 miles with ⅞-inch total stretch, and the rider anticipated 1500 miles more from the chain before it became useless, but this was done at the expense of extreme care for the chain was removed, cleaned and boiled in a preparation of oil, tallow, and graphite at the end of each 100 miles of service.

It is readily conceivable for a chain to successfully drive a push bicycle many times the mileage of the motor propelled machine for the movement of chain around the sprockets is much slower and the pressure a great deal less.

It seems to me the problem of the chain maker is a means for protecting the joints from grit, and retaining the lubricant. In regard to the wear on the sprockets other conditions being equal, these wear in proportion to the number of teeth, the wear being no greater on the direct drive than on the chain countershaft drive.

A belt driven machine geared 5 to 1 to mount a gradient equal in steepness to the steepest that can be negotiated with a chain driven machine of 2¼ H. P. geared 7 to 1, would require 1 2-5 times as powerful, or a 3.15 horse power motor, other conditions being equal but it would mount the gradient as much faster in proportion as the power is greater. That is to say if the 2¼ horse power machine will climb the hill in 35 seconds, the 3.15 machine will also climb the same hill in 25 seconds. In drawing this conclusion I have disregarded the effect of air resistance which increases with the square of the velocity. So actually the time would be somewhat over 25 seconds, under normal conditions.

If the problem is to calculate the H. P. required to bring the machine geared 5 to 1 to the top of the hill in exactly the same time as the one geared 7 to 1, the motor would require to be over geared to an extent sufficient to slow down to reduce the power output to 2¼ H. P.

We must find then a speed at which the 2¼ H. P. machine is giving out its full power. An elaborate test places this at very nearly 2800 R. per minute. Taking this as a basis and having in mind that the piston speed must be the same, the larger the cylinder the slower the speed, so for every additional increase in power of 10 per cent. it calls for a corresponding decrease in speed of motor which we will assume to be 5 per cent., that coming very close to observations made.

Since the greatest efficiency of a 2¼ H. P. motor is at 2800 R. per min., and the rear ratio on the higher powered motor is 2-5

oes not decrease in this regular ratio, but r enough for this calculation.

ow if a motor is developing 2¼ H. P. at R. per min. its normal or full capacity be found in the table compiled from the wn and assumed facts. In this table we that a motor developing 2.8 H. P. at its t efficient speed of 2480 R. per min., has a er of 2¼ H. P. running 2000 R. per min. have taken for granted the chain and transmission to be equally efficient. I not consider either method to have much antage in power transmitting efficiency r the other when conditions are as nearly fect as they can be made, so we may lect this feature and conclude broadly t a machine of 2.8 H. P. geared 5 to 1 will respond in greatest climbing capacity with achine of 2¼ H. P. geared 7 to 1.—C. H. M.

NITION AND LUBRICATION TROUBLES

4 Salem St., Charlestown, Mass.

r Sir;—

there any particular reason why a wipe tact timer will not work as well as a make break on a non-vibrator coil? I notice t motorcycle makers with one exception, use the latter kind, with its platinum nts to be kept clean and proprely ad- ed, while certainly a wipe contact, which elf-cleaning and needs no adjusting is the plest.

made a wipe contact breaker, consisting a cam which hit the end of a very short stiff steel spring, and it would miss bad- at high speeds, while a make and break work perfectly on the same engine. The ng was only about one and a half inches g, with a piece of steel brazed onto the to take the wear, and so thick that there absolutely no vibration to it, so the sing could not have been caused by the ng jumping over the cam without touch- it. The time of contact was about one- ntieth of a revolution of the cam. Per- s you can explain this trouble.

have had considerable trouble with oil king out thru bearings in the crank case; ven put a check valve in it to allow the air escape, but this did no good. I have come the conclusion that a leaky piston will etimes have a great deal to do with this l of trouble, part of the gases of the ex- sion being forced past it into the crank e, causing considerable pressure there. piston of my engine, is not leaky enough seriously affect the power, but there is a ht escape of gas past it.

machine referred to is giving very good sults. Oil does not interfere with its prop action, and when the mechanism is right y can seldom trace trouble to the timer.

In a device where the contact is made dire by a cam attached to the one-half time sha trouble has been experienced on account poor contact between shaft and its bearing The thin film of lubricating oil tending to i solate the shaft from the ground.

A direct ground contact to the end of t shaft, which is not lubricated, by means a light spring pressing a hardened steel pi or carbon against it will remedy the difficult I would advise a contact of at least one-ten of a revolution of the cam shaft for spark

A leak of pressure past the piston w produce pressure in the base which will for out the oil, but often the check valve is t main cause. In the check of the ball varie I have found trouble from the fact that t ball did not seat rapidly enough to check t incoming air. A light spring pressing on t ball improved its action greatly.

A three-inch tire is not so stable on grea roads, as the greater surface offered to t road prevents it from sinking in, which a smaller tire saves side slips owing to t groove it has made in the surface.—C. H.

GETS STALLED ON HILLS

New York

I have a new motorcycle, 3 horse pow which I cannot get to take any grade at and I cannot advance the spark only a ve little because the motor will stop if it is a vanced.

The batteries are O. K., plug, spark, co pression and valves are all right and it timed right. It will go good on the lev but you cannot advance the spark on t level and a small grade will stop it. The bo is 3-inch, 3½-inch stroke, 3 H. P. at 1800 P. M. Intake valve, 1-inch exhaust 15- Everything seems to be O. K. as far as can see. What do you think is the cau of the trouble? Would a generation val give better results on a motorcycle than carburetor, if not, why not?—J. BURTAN

The valves are too small for the size the motor. The intake valve should be 1 exhaust 1¼ at least. However, I think yo main trouble is in the carburetor which pro ably gives a mixture too rich on the hi speed. A generator valve would be no bett unless it is provided with means for adjus ing the mixture for all speeds, either aut matically or otherwise.—C. E. D.

ew "Standard" Motor Cycle Pedal

new motor cycle pedal has been ed to the line of the Standard Com-

pany, Torrington, Conn., which they ca the "Standard" No. 3. This pedal h large bearings designed for smooth ru ning, and the balls are 5-32 inch in diam ter, the same sized balls being used both ends. The shaft is made from inch stock.

A prominent feature of this pedal is excellent lines and ample proportion The rubbers are deeply corrugated, a the tread is broad, assuring a firm gr for the user's foot and a maximum of co fort. This pedal was shown on a nu ber of motor cycles at the Madison Squa Garden Show, and has been adopted, are advised, by a number of motor cyc makers for their 1908 machines.

A. P. B. Association's New Ruling for 1908 Racing

At the October meeting of the American Power Boat Association sixty-two yacht and motor boat clubs were enrolled. At this meeting the association acted on, and consented to the following amendment, proposed jointly by the Thousand Island and the Chippewa Yacht Clubs.

The amendment states that races for the cup in 1908 will be limited to boats of Class X; that is to say, racing boats of not over 40 feet water-line length. There will be no restriction on the number, size and horse power of the motors, except that each boat shall contain and be fitted with such mechanical power as will drive her astern at a speed of not less than 4 knots an hour in still water. There will be no time allowance. These conditions, however, apply only to races that may take place in 1908.

All Ready for the First Motor Boat Show

Manager Chester I. Campbell, 5 Park Square, Motor Mart, Boston, Mass., has all plans ready for the first of the three great national Motor Boat shows which will be held in the Grand Central Palace, New York City, December 7-14.

The show season of 1908 opens with virtually a single great exhibition, in three sections geographically, but under a single management, that of the trade itself, and the single direction of one capable man.

The situation in brief is that the National Association of Boat and Engine Builders, made up of some of the most important representatives of the business thruout the country, will have immediate charge of the New York show, while the two local associations, the New England Engine and Boat Association in the east and the American Association of Engine and Boat Manufacturers in the west, will have charge of the other two shows, in Boston and Chicago, respectively. These three associations are working in harmony for the success of a single large show in each of the three cities, with such an arrangement of dates and such conditions as to transportation, fitting-up of spaces, signs ,etc., as will make it possible for a builder to exhibit at each of the three shows in turn at a minimum of trouble and expense. Further than this, the enterprise is a mutual one, the profits going not to outside promoters, but by a pro rata division to the exhibitors themselves.

Bermuda Motor Boat Race

Conditions governing next year's long-distance motor boat race to Bermuda, under the auspices of the Motor Boat Club of America, have been completed. The event will be for boats up to 70 feet over-all-length. The race is scheduled to start from New York Harbor on June 6, 1908, and first boat to arrive at Bermuda will be the winner, as the race will be run without time alowance, with all boats racing in one class.

The first prize will be the Bennett trophy which must be won three times in succession to become the permanent property of the winner. Trophies will be given to second and third boats to finish. A cash prize of $1000 will also be given to the winning boat and $500 to the second boat.

Buffalo's Power Boat and Sportsmen's Show will be held in Convention Hall, Buffalo, the week of February 3.

The Chicago & Alton Railway Company, of Shelbyville, Ill., is just completing its first gasoline railway car. The motor to be installed is of the 4-cycle, water-cooled type, manufactured by the Anderson Engine Co., Shelbyville. It is one of their improved 4-cylinder marine engines, and will have a bore of 9¼ inches by 11 inches stroke.

1,155 Copies to Philadelphia and foreign, etc., under stamps.

1,000 Copies to Chicago Show.
20 Copies held in reserve.

21,531
1,300 Back numbers sent out.

20,231 Total copies December edition.
Of these
12,279 Were paid subscriptions.
5,101 Delivered to News Company.

17,380
1,130 Returned by News Company, to December 14, 1907.

16,250 Net total paid.

We print on this page each month an exact statement of the number of copies printed and distributed of the preceding issue of the "Cycle and Automobile Trade Journal."

The bindery count of actual complete copies produced of the December issue was 20,231.

Of these, 23,610 pounds were mailed at pound rates, as shown by post office receipts. Each copy weighs 26½ ounces, representing 14,255 copies, and 1,130 copies of back numbers and copies returned by news companies are accounted for, in addition to the total for the month.

We will be pleased to verify the above figures at any time to any one interested.

On page 88 of the December issue an error was made in regard to changes in the executive committee of the National Association of Automobile Manufacturers as the letters A. L. A. M. were used instead of N. A. A. M.

The Automobile Club of Italy has issued rules for the 1908 Targa Florio race, which is to be held next May over a 400 to 450 kilometre course in Sicily. The contest is open to four-cylinder cars of a bore between 120 and 130 m.m., and weighing 1000 kilogs. The number of vehicles of any one make is restricted to four.

Automobile Coming Events

January 1—Speed Trials. South Indian Motor Union.

January 1-2—Annual Endurance Run. Quaker City A. C.

January 4-11—Dublin Show, Ireland.

January 14 to 18—Hartford, Conn. Automobile Show. Foot Guard Hall.

January 18-February 2—Fifth International Auto Exposition, Palace of Fine Arts, Valentino Park, Auto Club of Turin, Italy.

February 10-15—Detroit, Mich., Tri-State Automobile and Sportsmen's Association's Show, in Light Guard Armory.

March—Ormond-Dayton Annual Race Meet, under management of A. C. A.

March 7-14—Sixth Annual Auto Show at Mechanics Building, Boston, Mass., Boston Automobile Dealers' Association, Chester I. Campbell, Mgr., 5 Park Square, Boston.

February 17 to 22—Cleveland. Automobile Show.

February 24 to 29—Auto Show and Gymkhana. Bombay, Ind.

March 7 to 14—Automobile Show. Mechanics Bldg., Boston.

March 9 to 14—Sixth Annual Automobile Show. Convention Hall, Buffalo, N. Y.

March 21 to 28—Automobile Show. St. Lawrence Arena, Toronto, Canada.

March 21 to 28—Annual Cordingly Show, London, England.

March 26—April 24—Second Annual International Commercial Vehicle and Motor Boat Show. Olympia, London. Society Motor Manufacturers and Traders.

April 4 to 11—Pittsburg Automobile Show. Duquesne Garden.

April 5-12—Third Annual Automobile and Sportsmen's Show, Montreal, Canada, Arena, M. Jaffry, Mgr.

April 6-11—Second Annual Show of the Pittsburg (Pa.) Automobile Club.

May 12—Sicily, Targa Florio, Automobile Club of Italy.

May 30—Hill Climbing Contest at Sport Hill, Easton, Conn., under direction of the Automobile Club of Bridgeport.

July 14—Paris to London, Aerial Race.

July .. —Grand Prix Automobile Race on Dieppe Circuit, under direction of Automobile Club of France. (Exact date to be announced.)

In defense of the proposed $1,000 entry fee for the stock touring car race next spring, Mr. Morrell calls attention to the heavy expense of properly policing and oiling the course, and at the same time holds out to the entrants the hope of a rebate from grand stand revenue which he thinks will practically cut the $1,000 fee in half.

A. A. A. Outlines Plans and Policies

Following upon the experience of the fiscal year just closed, the American Automobile Association has drawn up plans and policies for the ensuing year.

The association intends to hold a national convention, with particular reference to legislation and good roads, at some central place during the summer, at which time it will also promote several technical contests.

In legislation, the present agitation looking toward the adoption of a federal registration bill will be continued.

Sanctions will be granted only by the racing and technical boards on application made thru national headquarters.

In short, sanctions, supervision and responsibility, or neither; no promoters, other than club or state associations, no graft.

1908 Executive Committee of the A. A. A.

President William H. Hotchkiss, of the American Automobile Association, announces the new Executive Committee as follows:

William H. Hotchkiss, Buffalo, N. Y.
Lewis R. Speare, Boston, Mass.
George E. Farrington, East Orange, N. J.
Charles Thaddeus Terry, New York, N. Y.
Asa Paine, Minneapolis, Minn.
N. H. Van Sicklen, Chicago, Ill.
Jefferson De Mont Thompson, New York, N. Y.
Frank B. Hower, Buffalo, N. Y.
Robert P. Hooper, Philadelphia, Pa.
A. G. Batcheldor, New York, N. Y.
Stanford L. Haynes, Springfield, Mass.
F. T. Sholes, Cleveland, O.
Paul C. Wolff, Pittsburg, Pa.
Harry M. Rubey, Macon, Mo.
L. E. Myers, Chicago, Ill.
James T. Drought, Milwaukee, Wis.
Frederick H. Elliott, New York, N. Y.

The committee comprises seventeen members. The membership consists of four officers, six chairmen of boards, and seven directors at large.

Washington D. C. Run

Sixteen of the 26 starters in the sealed bonnet contest of the Washington, (D. C.) Automobile Club on December 10, finished with perfect scores. The survivors of the 118 mile run over Maryland roads numbered twenty-three.

A. A. A. Technical Board

The Technical Board of the A. A. A. has been announced as follows. Chairman, N. H. Van Sicklen, of Chicago, Ill.:

David Beecroft, Chicago, Ill.
H. O. Smith, Indianapolis, Ind.
Edgar Apperson, Kokomo, Ind.
Walter C. Baker, Cleveland, O.
Henry Souther, Hartford, Conn.
S. N. Colburn, Minneapolis, Minn.
E. R. Thomas, Buffalo, N. Y.
Clarence E. Whitney, Hartford, Conn.
E. T. Birdsall, Rochester, N. Y.
Angus Sinclair, Newark, N. J
J. C. Kerrison, Boston, Mass.
Henry Ford, Detroit, Mich.
H. M. Rowe, Baltimore, Md.
A. C. Newby, Indianapolis, Ind.
A. L. Riker, Bridgeport, Conn.
Roy F. Britton, St. Louis, Mo.

Long Island A. C. Banquet

The Long Island Automobile Club held its annual election on December 4th, and on the 6th the annual dinner took place at the club house, 360 Cumberland street, Brooklyn, N. Y. The chief feature of the evening was the presentation of trophies which had been offered at different times during the year for club runs, tours, etc. The new officers are Charles Jerome Edwards, president; Dr. C. P. Parker, vice-president; Russell A. Frield, secretary, and Louis T. Weiss, treasurer.

October Exports Show Increase

Statistics for the month of October, 1907, show an increase in automobile exports of $70,974 over that of the corresponding month in 1906, and $106,195 over those of the month of September, 1907.

	October 1906	October 1907
Exported to—		
United Kingdom	$43,633	$118,470
France	15,475	29,199

Africa	4,847	450
Other countries	344	2,362
Total automobiles and parts of	$247,094	$318,068

Atwater Kent Continues Test

The Atwater Kent Company, of Philadelphia, Pa., it will be remembered conducted a demonstration in New York city at the two shows with one of its generators, showing the high battery economy obtainable from its use. At the close of the demonstration with the odometer reading 4249.3 miles the batteries were tested and showed 6 amperes each. With the batteries showing at 4½ amperes three weeks later, the outfit was shipped to the Chicago show, where it was again sealed and started. At the time the spark plugs began to miss the odometer reading was 5328.8 miles, and the batteries were again tested, showing three amperes.

This is certainly a remarkable record for dry batteries, and substantiates the claims made for the generator by its maker.

The following have been appointed as chairmen of the different boards comprising the American Automobile Association: N. H. Van Sicklen, Chicago, Technical Board; A. G. Batchelder, New York, Publications Board; Charles T. Terry, New York, Legislative; Robert P. Hooper, Philadelphia, Good Roads; Frank B. Hower, Buffalo, Touring, and Jefferson De Mont Thompson, New York, Racing.

Detroit's Noteworthy Show

The first of the two shows planned for Detroit this winter was held in Riverview Park auditorium, December 7 to 14 under the auspices of the Detroit Automobile Dealers' Association and proved a very successful exhibition. The building was artistically decorated with banners and streamers, the color scheme being gold and green.

The exhibition space was all taken up for car display, there being about a score of exhibitors showing thirty-one makes of cars.

The E. R. Thomas Detroit Company inform us that the agency for Chicago territory for the Thomas-Detroit car will be changed on January 1, as the company expects to close a direct agency or open a branch. Coey & Co., will continue to handle the Thomas Flyer.

Writ of Certiorari Issued in Acetyelene Burner Suit

We are informed that the United States Supreme Court has granted the petition of M. Kirchberger and J. Von Schwarz for a writ of certiorari allowing a review of the decision of the U. S. Circuit Court of Appeals of the 6th circuit which recently decided against the validity of one of the Von Schwarz patents on acetylene burners. Writs of Certiorari are seldom issued we are told, and only when the Supreme Court feels that the lower court has made a gross error, and in view of this fact the Kirchberger and Von Schwarz interests have great hopes of a favorable final decision in about one year. In the meantime they warn infringers that they will not be immune from the payment of damages should the decision be, as is expected by Kirchberger and Von Schwarz, in their favor.

A. A. A. Adds Members

The following clubs were elected to membership at the meeting of the American Automobile Association in Chicago, December 6: Savannah A. C., of Georgia; A. C., of Hawaii, and Calfornia State A. A.

A. C. A. Will Manage Beach Races

At a recent meeting of the contest committee of the Automobile Club of America the committee ratified the agreement with the Florida East Coast Automobile Association that the A. C. A. manage and run the Ormond races in March, 1908.

The Demoralizing Effect of the Shows

In the early history of the automobile industry there was, doubtless, urgent need for the enlightenment of the buying public in regard to the mechanism, operation and general utility of automobiles. For this purpose, automobile shows were early instituted at which an opportunity was afforded the public to learn of the new vehicles. However, as they became more and more familiar with automobile construction and operation, the necessity for such shows gradually disappeared and the shows became more and more a society function and a place at which the dealers were enabled to meet a large number of manufacturers and arrange for agencies. But the time of year at which the shows took place was not entirely suited for this latter purpose, and so, even in this respect the shows did not fill as extended a field as could have been possible.

At the present time, as far as pleasure cars are concerned, there is very little, if any, necessity for such exhibitions and their continuance has become not only an enormous burden to both the automobile manufacturer and the accessory maker, but has also a very disturbing influence upon the routine work of nearly every automobile factory in the country. It is well known that for a considerable period, previous to the large shows, there is, in nearly every factory, a period of unrest, unprofitable and hasty work, usually upon a few show cars, while the preparations for the work of turning out the season's output are almost, if not entirely, lost sight of. During the shows, the chief men are usually away from the factory where, in many cases, the business is practically at a standstill, letters remaining unopened until their return, in fact the entire factory force is, for the time being, in a disorganized state.

If this is true of the automobile makers it is doubly true of the accessory manufacturers, who are unfortunate enough, owing to the multiplicity of shows which they are almost forced to attend, to be absent from their plants for a considerable period and are required to bear extremely heavy expenses. Owing to the peculiar patent situation and the efforts of the importers to make a specially brilliant showing, as the demand for foreign cars in this country gradually diminishes, there have been held in New York City alone this year a series of shows which have, without question, had a very disturbing influence on the various automobile factory organizations.

The part which the automobile show has played in the advancement of the industry, it is not our intention to belittle. Unexcelled opportunities have been offered the makers for copying ideas in design and also methods of construction, resulting in the general betterment of the product. The public has gradually been enlightened and educated to appreciate the many advantages attendant upon the use of the new means of conveyance, until now the primary reasons for such exhibitions have almost, if not entirely, ceased to exist, yet the shows still multiply in number.

History repeats itself, however, and the very success of the shows must be their unmaking. From a few representative exhibitions in the large cities, the fever gradually spread until every small town also held its local automobile show and at the present time the number of these shows are entirely out of proportion to the results obtained and are exercising a decidedly demoralizing influence upon the industry as a whole.

One or two representative exhibits, with no admission fee, without excessive decorations, divorced from the idea of a society function and placed on a strictly business basis, could doubtless be made very profitable to both the accessory and car makers, without, as at present, demanding almost their entire attention for a prolonged period.

In the realm of the commercial car the situation is entirely different from that of the strictly pleasure vehicle, and business shows for business people will probably be held, with advantage, for many years to come.

Hosted by Google

In conclusion, let it be said that the sooner those interested in the future welfare of the business eliminate all the unnecessary ostentation, trumpery and display which has been altogether too prominent in the past and base their efforts solely on conservative business principles, the sooner will the manufacture of automobiles, accessories and parts assume its rightful place among the important and permanent industries of our nation.

Lack of American Made Taxicabs

The sudden and now rapidly growing demand for Taxicabs has found the American automobile makers almost, without exception, totally unprepared. The steady increase in the number and popularity of these vehicles abroad has been persistently overlooked by our manufacturers, although several car makers were asked as far back as 1905 to design and test out such cabs. They, however, were apparently not far-sighted enough to forsee the extent of the open field and at that time refused. The fact that the step from pleasure making to that of producing a serviceable cab is much less radical than the step to the manufacture of successful heavy trucks and offers a comparatively easy entrance into the Commercial car field was also set aside. Even at the present time there is no lack of those who fail to appreciate the breadth of the awakening demand for this class of vehicle which is surely and rapidly destined to replace our horse-drawn cabs in all of the larger cities of the country.

Owing to the hesitating attitude and lack of preparedness of the American makers, the promoters of the large New York companies who are introducing Taxicabs were forced to look elsewhere for vehicles which have been tried out, and could show actual records of continued successful performance for any considerable length of time. The result has been the loss to the American makers of some very large sales and the importation in quantity of foreign made motor cabs.

It is unquestionably true that Taxicabs are as far superior to horse cabs as our present street cars are to the antiquated bob-car with its walking specimen of horse anatomy. A motor cab can easily cover from 90 to 100 miles paying distance in a day, as compared with about 25 miles as the most for a horse cab, even under the most favorable conditions. They are not only capable of doing the same work in a much quicker and more satisfactory manner than the horse, but at once open up an entirely new field peculiar to themselves, which field is absolutely beyond the realm of the horse-drawn vehicle. In other words, a new era of transportation conditions is instituted. Regular service can be maintained between comparatively distant points, short pleasure tours can be made into the country and even communication between suburban points can be regularly and satisfactorily carried on. Another feature which cannot be overlooked is the increased cleanliness and improvement in the sanitary conditions of the streets caused by the retirement of the horse.

European experiences show clearly that the public will not use horse cabs if Taxicabs can be had, and will even stand in the rain waiting for such means of transportation. These cabs easily do two and three times the work of the ordinary vehicle, and when the tires are maintained by contracting companies, injured ones being daily removed and replaced by new tires from other cabs, the upkeep is not excessive. When the chauffeurs are required to furnish gasoline and oil, with of course an increased salary, economy of operation is secured. Yet in spite of all the advantages known to accompany the use of motor cabs, only a few American makers are even now preparing to supply such machines and none can show any record of continued service such as demanded by most companies before installing new vehicles. To be sure, several American makers have recently announced their intention of entering into the manufacture of motor cabs and at least two have already placed such cars on the road, but the fact remains that the average American automobile manufacturer has been so completely occupied with the production of strictly pleasure vehicles that he has not noticed or has not drawn the natural conclusions that would be expected from an investigation of the conditions existing abroad in regard to the new type of cab.

European makers have had several years start in the manufacture of motor vehicles and the European public have also had the same advantage in regard to the use of these machines, and it is but fair to suppose that, with few exceptions, where peculiar conditions may affect the attitude of the public, the general demand in this country will be the same as that abroad. It is somewhat surprising that, knowing these facts, American manufacturers do not profit more largely by the panorama of experiences constantly spread before them and take a short cut instead of following blindly a longer, more circuitous and more costly route to the same goal.

Is Finality of Chassis Design Reached?

A careful observer, having had the opportunity to visit all of the recent automobile shows, could not overlook the marked improvement in all of the American-built cars, in the finish, material used and in changes of detail, but must also have been impressed with the fact, that particularly among the licensed makers, very few radical changes have been made

Hosted by Google

for 1908. This might lead to the supposition that finality in motor car chassis design has at last been reached; we say chassis, because the bodies will always vary to suit the ever-changing weather-vane of public fancy.

A survey of the machines shown particularly at the licensed exhibition, indicates the intention on the part of the makers to cater almost entirely to the exclusive few, as extremely high-powered, high-priced runabouts and most luxuriously-appointed limousines were largely in evidence. When it is considered that the mass of the future automobile buyers will not be purchasers of these types, it is very evident that the makers must eventually change their present designs to types which will appeal to the largest number of purchasers.

Of course, it is understood that there will always be a few manufacturers of cars for the elite, but these must necessarily be limited in numbers. There is no question but that the manufacturers have been allowing themselves to be carried along by the passing fancy of the public, and that just as soon as the present wave of enthusiasm for high-powered, high-priced, speed cars has subsided, the horse power of the runabouts and even of the touring cars and the weights, which are in some cases excessive will be cut down.

At the present time the high-priced American car is to a large extent based upon foreign practice. When the good features are followed intelligently there is certainly no objection, but when a blind parrot-like imitation is made it would seem that such designs cannot remain final. Take, for example, the arrangement of gear shifting levers and the steering wheel. In parts of Europe, where rules of the road require vehicles when meeting to pass to the left, there is every reason for placing the driver on the right side of his car, but in this country where operators are required when meeting to pass to the right, there are great advantages in driving on the left side. The present arrangement in nine out of ten machines entirely blocks the entrance to the car on the driver's side, which is necessarily the side next the sidewalk, unless the driver goes to the trouble of heading the machine in the opposite direction. It is thus necessary to step into the street and walk around the car in order to enter the front seats. At once many will raise the objection that changing the driver to the left would bring the gear shifting levers in a position to be operated by the left hand, but this does not necessarily follow. With the steering wheel on the left exactly the same arrangement of levers could be placed between the front seat passengers, leaving both sides of the car entirely free, shortening the linkage necessary to connect with the change speed gears, and also allowing the operator to look ahead when endeavoring to pass vehicles going in the same direction, and also accurately judge his clearance of vehicles which are going in the opposite direction, which latter is a decided advantage, as an accident by machines when meeting is always followed by much more serious consequences than the touching of vehicles going in the same direction. Every argument seems to be in favor in this country of left front seat operating, yet retaining the right hand gear shift and brake lever control, and it is believed that when the public reaches the discriminating state of automobile knowledge it will demand left front seat driving instead of accepting blindly just what the other fellow has.

There is, however, a class of builders who are comparatively recent entrants into the field, who are building machines to suit American conditions. We refer to the high wheel, power-buggy builders. The latest advances in these machines show longer wheel bases, accessible motors, unobstructed entrances and suitable clearance for American roads, and it is believed that if for no other reason than that of the influence of these new high wheelers, there will be developed an intermediate type of automobile which will be a comparatively light, low-priced, large-wheeled, long wheel-based machine, which partakes of both the features of what is to-day the standard touring car, and also of the latest types of the high-wheeled vehicles.

The large number of new arrangements shown in these vehicles at the Chicago Show, indicates that finality of design in them is yet distant. The ever-increasing number of 2-cycle motors, air-cooling arrangements, and friction change speed devices, is also clearly indicative of transition in the buggy types, and altho the lack of changes in the product of the licensed manufacturers might be construed to mean finality, we firmly believe it simply indicates the pause on the crest of the wave before the return to lower powered, lower priced and lighter weight machines.

Asa Goddard has tendered his resignation as secretary of the Cleveland Automobile Club, as he intends to devote his entire time to the good road movement. Mr. Goddard has been appointed on the Good Roads Board as the Ohio representative.

The Massachusetts State Automobile Association has changed the date of the annual meeting from April to October, thus giving the new officers all winter to prepare for their duties, instead of entering upon them at the beginning of the out-door season.

Chicago's Automobile Show

The palm for automobile exhibits is now justly claimed by the progressive city of the Middle West. The recent Chicago show not only brought together the largest collection of self-propelled vehicles ever exhibited on this Continent, but was noteworthy on account of the optimistic feeling everywhere present, being in marked contrast to the depression felt by many at the New York shows on account of the financial situation.

A spirit of independence and a general freedom from the gloomy aspect of the East was everywhere manifest. The entire atmosphere was much more of a businesslike and substantial nature than in any previous show, and the segregated commercial exhibit, undoubtedly marks the beginning of the future, free business commercial shows.

In line with this thought, is the Trade show, for dealers only, leaving to the agents in the various cities the unrestricted show business where a curious public gathers to inspect the various styles and select vehicles for their immediate use. In shows, as in other things, specialization will eventually reach this point, and the quicker it is brought about by show managers, who properly should be those most interested in the product, namely the builders, the better it will be for the trade generally.

A DIVERSIFIED EXHIBIT.

This show was unquestionably the largest and most diversified gathering of the year. The variety, from motorcycles and auto buggies thru a wide range of styles and prices in touring cars up to the limousines, speedy race-abouts, not to forget the splendid electric vehicle display, was sufficiently varied to meet all desires and purses, and a separate building devoted to commercial vehicles augurs that in future, exhibitions of this class must be held separately and without admission fees; for, being strictly a business product, the public will not pay a price and the manufacturers will not exhibit, where men coming with an eye to business only, cannot have easy and uninterrupted access to the exhibits.

BRIEF MENTION OF NOVELTIES.

While there were no startling novelties, the Hobbs-Renault self-starter shown on the Lorraine car, appears to be a quite simple solution of the self-starting problem, and holds forth promise of the time when gasoline motors will start as easily as steamers or electrics to the great delight of many, who but for the cranking would be users to-day. The device consists of a piston which pushes a rack and is returned by a spring, compressed air being the working force.

The two-cycle motor was not only shown on pleasure vehicles like the Atlas and the largest trucks as made by the Reliance Company, but was found in a slightly modified form at the booth where the Teg motor was exhibited. Its principal novelty was the built up crank-shaft, having on one crank side, a small crank pin which fits into the hollow full size pin carried by the other crank side. The connecting rod is solid and slips on the full size pin before the two halves of the crank are assembled in the case. A further novelty is the arrangement of the transfer port which opens from inside the piston, out thru the cylinder wall and then back into the cylinder, thru the usual admission port; the new charge being forced to pass cooling ribs in the piston before entering the ports and thus keeping the piston much cooler than is customary. Thus permitting perfect air cooling in a 2-cycle motor three and one-half by three and one-half, which it is claimed has delivered as high as nine horse power, per cylinder.

BUGGY TYPES.

Several new auto buggies were shown, making a total of ten or more. These exhibit a wide variety of designs from the simpliest buggy forms to constructions strictly of conventional automobile design. In one the balance gear is omitted and in its stead are substituted friction disks at each end of the counter shaft, the thought apparently being that instead of the rubber tires slipping on the ground to their detriment in turning a corner, the friction disk would slip and thus permit one wheel to go faster than the other without detriment to anything. In still others, no balance gear is used, because having a rope or friction drive, they depended upon the slipping of the driving surfaces, rather than the slipping of the wheel tires. In still a different form there was a proposed connection between the steering lever and the friction tightening rods, so that in turning a corner the belt, or driving device, to the outer wheel would be tightened in contact, while that to the inner wheel would be loosened, with the result that the outer wheel is driven and the inner wheel runs free in a manner theoretically superior to a balance gear. The fact that this device has been patented some years, yet seems not to have found any extensive use, may be an argument against its efficiency and may indicate some defects not apparent by inspection.

While the conventional friction drive employing disks in planes at right angles to each other, and as used on Lambert cars, was generally seen, one exception secured two speeds forward and reverse by fitting the motor shaft with stepped cone pulleys and parallel but underneath, the propeller shaft is similarly equipped, the two being connected by a wide short belt which can be tightened by lowering the

Hosted by Google

propeller shaft and thus serve as flexible joint, friction clutch and transmission gear. A V-grooved set of pulleys or gears at one end gives the reverse motion when the propeller shaft is lifted so as to bring the grooves into mesh.

On still another the engine shaft carries on each of its opposite ends two flat faced pulleys, the smaller telescoping into the larger by means of a push pedal. Each rear wheel is connected by a chain to a short counter shaft on the inner end of which is a two-step pulley the smaller step of which comes into contact with the large engine pulley when the countershaft is raised; but with the smaller telescoped pulley extended, a slightly less raising of the countershaft brings the large step of the countershaft pulley into contact with the smaller of the crank-shaft pulleys, and so gives a slow speed forward. Slipping of the friction surfaces on one side or other of the engine permits turning corners without the use of the balance gear and reversing is accomplished by pushing idlers against both sets of the pulleys when the countershafts are not raised.

At a private show room was a novelty that goes far to indicate still further chances for improvement in friction driven autos. This machine has cylinders lengthwise of the body, but located high in the bonnet, a most unusual position for a 2-cylinder opposed engine. The crank-shaft is vertical with the fly-wheel on the bottom end and the friction disk slidably mounted on the propeller shaft is brought into contact with the undersurface of the fly-wheel.

The rapidly increasing diversity of forms indicates that the day of conventionality and its iron-clad rule has passed and that merit rather than fashion coupled of course with price, will determine the commercial success of the future automobile designs. A consummation certainly to be desired.

Trade Changes and Removals

Autolyte Mfg. Company has acquired the automobile department of Messrs. Sibley & Pitman, of 26 Warren street, New York City, and has moved to that address.

Coppock Motor Car Company has removed from Marion to Decatur, Ind.

Continental Caoutchouc Company has removed its Detroit branch from 226 Jefferson avenue to 260 Jefferson avenue.

Dragon Automobile Company, of Philadelphia, Pa., has been succeeded by the Dragon Motor Company, with a capitalization of $1,000,000.

Gray Motor Co., of Detroit, Mich., has filed articles of incorporation, increasing its capital stock from $30,000 to $70,000.

Hornecker Motor Mfg. Company, of Whiting, Ind., makers of the Torpedo motorcycle, will move to Geneseo, Ill., about January 1.

Keith Electric Company, The, Beaumont, Tex., has filed an amendment to its charter, changing its name to Keith Electric Auto Co.

Matheson Motor Car Company, of Wilkes-Barre, Pa., will hereafter deal with the trade direct instead of thru the Palmer & Singer Mfg. Co., of New York as heretofore.

Reliance Motor Cycle Company has removed from Elmira to Oswego, N. Y.

Smith & Co., D. B., Utica, N. Y., has been succeeded by the Yankee Muffler Co.

Thomas Auto-Bi Company, of 1573-1575 Niagara street, Buffalo, N. Y., was recently reincorporated under New York laws as the The Auto-Bi Co., with $50,000 capital.

Willyoung Appliance Company, Yonkers, N. Y., has been succeeded by the Westchester Appliance Company.

Fires, Judgments and Failures

Berkshire Motor Car Company, Pittsfield, Mass., Fred T. Francis, has been appointed temporary receiver.

Crocker-Wheeler Company, East Orange, N. J., garage damaged by fire to the extent of $100.

Duplex Ignition Company, 307A West 36th street, New York City, schedules in bankruptcy show liabilities $8,387, and assets $3,131.

Electric Vehicle Company, of Hartford, Conn., went into the hands of a receiver on December 10, owing to its inability to repay a bond issue of $2,500,000, which matured on November. 1. Halsey M. Barrett, of Newark, and Henry W. Nuckles, an officer of the company, were appointed receivers.

Goodman Cycle Company, Union, S. C., store destroyed by fire, partially insured.

Huntington Automobile Company, Huntington, N. J., receiver has been appointed.

Knox Automobile Company, of Springfield, Mass., for sometime past in financial straits, is now on a fair road to recovery. The liabilities will be capitalized and the creditors will practically conduct the business until their claims are discharged.

Leather Tire Goods Co., Newton Upper Falls, Mass., plant destroyed by fire. Loss aggregates $50,000.

Peacock Inn., Mayville, N. Y., garage, totally destroyed by fire. Damage amounts to $10,000.

Star Ball Retainer Company, of Lancaster, Pa., suit for infringement of ball retainer by Sartus Ball Bearing Company, New York City, was denied by court.

Shoemaker Automobile Company, of Elkhart, Ind., recently placed in the hands of a receiver, has been granted an extension of six months.

St. Louis Motor Car Co., Peoria, Ill., bankrupt, machinery and unfinished product purchased by Harry G. Finklistein and Warren Kinsey, of Peoria, Ill.

Trident Tire Company, New York City, judgment for $1,890, granted in favor of the Standard Welding Co., Cleveland, Ohio.

Muncie Auto Parts Company, of Muncie, Ind., went into the hands of a receiver on Nov. 29, owing to the financial stringency.

Legislative and Legal

MISSOURI.

St. Louis.—Council passed bill prohibiting the storing of gasoline within garage buildings.

PENNSYLVANIA.

Philadelphia.—The State Superior Court in reversing a Philadelphia Common Pleas Court decision, held that when a chauffeur runs down and kills a person in an automobile when not attending to the business of its owner, the latter can not be held liable for damages.

Chas. Brandenburg, of Silver Lake, Ind., was fined $1.00 and costs and sent to jail for ten days on a plea of guilty in the Circuit Court, on the charge of placing a log on the road in order to wreck an automobile owned by Olinger & Marvel, of North Manchester.

Autolyte Mfg. Co., New York City, has acquired the automobile department of Sibley & Pitman, of 26 Warren street, same city, and has moved into the latter's building where offices have been taken on the first floor. Mr. Pitman has been elected treasurer of the company, and A. H. Funke remains general manager.

Hosted by Google

Haynes Car Wins 600 Mile Chicago Reliability Run

Frank Nutt, driving a 30 H. P. Haynes roadster, won the three-day reliability run of the Chicago Motor Club on Tuesday, Wednesday and Thursday, November 26, 27 and 28. Nutt achieved his great victory over a field of thirty-five starters in the most exciting and exhaustive test ever given American motor cars.

Of the twenty-five cars to survive the contest the Haynes was the only one to finish with a perfect score and is therefor the winner of the $1000 trophy. In addition, Pilot Nutt, of the winning car, gets the McElligott cup, which was given for the winning driver.

Second place was given to No. 29, the Pierce Arrow 40 H. P. 6-cylinder touring car, entered by N. Paulman & Co., and driven by Arthur Kumpf, the well-known boy driver. This car was penalized two points because a grease cup lacked two turns of being tight. The $400 silver ale set offered by the Goodrich Company goes to this car. The Oldsmobile car, driven by Ralph Owen, won the third and last prize, the New Southern $300 cup. Altho the car went thru without incurring any penalties, it was discovered in the final inspection that the emergency brake could only be classed as in medium condition and a driving shaft universal joint boot being loose; 6 points were herefore imposed.

The first day's run was to South Bend, Ind., and return, a distance of 227 miles, and of the 35 starters only twenty-three survived with perfect scores. The second day's run was to Rockford, Ill., and return, a distance of 190 miles, at the finish of which sixteen cars remained without penalty. The third day, Thanksgiving, the run was made to Ottawa, Ill., and return, a little less than 200 miles, and the perfect score list was reduced to ten.

Of the twenty-five starters, only one, the Wayne roadster, was penalized for failure to make controls on schedule time. When the last day's run had been made the reports of observers showed that ten cars had finished with perfect scores so far as road work was concerned, but this was reduced considerably after the technical committee had gotten in its work of penalization, which work occupied their minds from the finish of the run until Friday noon, when a decision was reached.

Penalizations were made for loose nuts, lamps, lamp brackets, mudguards, grease cups, speedometers, bonnets, aprons, spring shackles, damaged lamps, bent guards, brakes not working properly, dead batteries, missing cylinders and for the breaking of seals.

On December 3, 104 members were received into the Automobile Club of Buffalo, which now makes a total of 1,127.

Tire Chains Prohibited on Automobiles in New York City Parkways

Notification was sent us by the Automobile Club of America to the effect that after December 16 the following ordinance would be in effect in New York City:

"No automobile or horseless or other vehicle, wearing chains over the tires of their wheels shall enter the public parks or the traffic roads under the jurisdiction of the Board of Parks, without permission of the Commissioner having jurisdiction."

This ordinance will be enforced on the following traffic roads under the jurisdiction of the Park Department:

Manhattan Riverside Drive, West 72nd Street, West End Avenue, West 86th Street, Morningside Avenue West, Cathedral Parkway (West of Seventh Avenue), 122nd Street, West of Morningside Park, 123rd Street, West of Morningside Park, Fifth Avenue from 59th Street to 110th Street.

Brooklyn: All macadam roads, such as the drives in Prospect Park, Eastern Parkway, Ocean Boulevard, Shore Road, Bushwick Avenue from Eastern Parkway to the extension to Jamaica Avenue, etc.

Bronx Spuyten Duyvil Parkway, Rockwood Drive, in Van Cortlandt Park; Van Cortland Park Avenue, in Van Cortland Park; Pelham Avenue, in Bronx Park; Eastern Boulevard, in Pelham Bay Park; City Island Road, in Pelham Bay Park; Crotona Avenue, in Crotona Park; Mosholu Avenue, in Van Cortland Park; Gun Hill Road, in Van Cortland Park; Mosholu Parkway, Bronx and Pelham Parkway, Shore Road, in Pelham Bay Park; Crotona Parkway.

Items

The proposed Austrian automobile show has been abandoned.

H. H. Van Tine, recently connected with the Sidney B. Bowman Co., has joined the forces of the Garford Motor Car Co., of New York City.

The Bedford Branch, Young Men's Christian Association, of Brooklyn, will soon start a course in automobile engineering.

The Automobile Club of America, on December 10, redeemed $20,000 more of its second mortgage bonds at par and interest.

A second international alcohol congress will be held in Paris at the time of the next automobile salon, under the presidency of the Minister of Agriculture.

C. S. Johnson has resigned as treasurer and general manager of the Continental Auto Mfg. Co., of New Haven, Conn., having sold to the company a large part of his holdings.

In the Mechanical & Technical department of our October number, page 114, it was inferred in an answer to a query regarding the "Hedgeland Anti-Skid" axle that it was probably no longer on the market, but since the publication of that answer the Hedgeland Mfg. Co., has commenced to actively push the sale of the latest model of this axle which was fully described in our December number, page 146.

ompany, Chicago, Illinois, U. S. A., was rganized in 1907 to exploit the motor car aventions of Mr. John O. Hobbs in self-tarting devices and "elastic" or spring-ushioned driving-shafts. This elastic haft is not a universal-joint substitute sed to drive through angular variations f the transmission line, but cushions the orque to avoid undue stress from excep-ional road-resistances or when starting.

Operations began in March, 1907, to per-ect the Hobbs self-starting motor car, rst placed on the road in 1903. Hobbs ad long been aware of the value of the ushioned drive and used his "elastic" ropeller shaft in the first Lorraine Model esigned by him, and placed on the road n May, 1907. Since last May this first Lorraine Model has been subjected to con-inued severe road tests with no revelation f defects, and it was shown without hange of any kind at the Chicago Decem-ber, 1907, exhibition as the Lorraine Model L.

passenger limousine body $5,500.00. gentleman's roadster body, two front se one or two rear seats, $4,250.00. Model "L" motor is four-cylinder, inches, 4-cycle, water-cooled, 55 H. P. n nal.

The Lorraine Models "M" and "N" the same in general design as Model but are smaller and lighter, having inch wheel base, with 30 H. P. four-c der motors. Model "M" has tires all inches. Model "N" has a roadster b two front seats and one rumble seat has tires 36x3½ inches front and inches rear.

NOTABLE FEATURES.

All the Lorraine cars are large, l large diameter tires, and are driven b cylinder, 4-cycle, water-cooled motors, "Triple Action" springs are fitted.

In addition to these features of e lence along conventional lines and in well-beaten paths of established const tion, the 1908 models are equipped

Fig. 1. Lorraine 1908 Model L, seven-passenger touring car, wheel base 124 inches, gage inches; tires all 36x4½ inches; motor, four cylinders, 5x5 inches, 4-cycle, water-cooled, 5 H. The cylinders are offset 1¼ inches. Jump spark ignition, with 4-coil box and special dyn current supply, fitted witn automatic cut-off. As an option the Lorraine ignition No. 2, sisting of jump spark plugs, 4-coil box, 6 volt storage battery and Simms-Bosch high ten magneto, is fitted. Cone clutch, leather-faced, with six, gradual engagement spring plun placed under the leather facing at the large end of the cone. Sliding gear speed change, t speeds forward and a reverse, with universal joints at each end of the Hobbs elastic peller shaft, and bevel gear to the divided and full floating rear axles. Weight, pounds. Price, with seven-passenger touring car body, $4500. With extra seven-passenger lim sine body, $5500. Model L chassis, with seven-passenger limousine body, $5000. Model L c is, fitted with Gentleman's Roadster body, seats for three or four passengers, $4250.

The 1908 line of cars includes four separate and distinct models of chassis, as follows:

Model "L," a seven-passenger touring car, same chassis fitted with a limousine body. Wheel-base 124 inches, gauge 56 inches. Tires all 36x4½ inches. The motor is self-starting from the driver's seat in all Lorraine cars by means of Hobbs modification of the Renault air-driven pis-

special devices in the way of the H self-start, the Hobbs cushioned drive the electric lamp lighters.

THE SELF START.

Unquestionably, the self-start is a damental requirement of elegant, c nient and safe motor car driving. No could be more discordant and misp than the necessity for hand-cranki magnificent and impressive 60-mile to

it is not too much to say that the self-start and the cushioned drive must become indispensable features of the successful automobile, so soon as the motoring public is made aware of the value of these possibilities.

The chassis is fitted with A. O. Smith Company axles, all wheels on ball-bearings, but Timken axles and bearings are placed to order. The steering actions and speed change gears are of their own design and construction.

THE LORRAINE SPRINGS.

The springs are "Triple Action" half-elliptics hung on coiled springs above, these coiled springs being placed under flat-spring ends; this flat spring having its

Digitized by Google

principal flat spring as to straighten the second, shorter, spring-leaves more rapidly than they would be straightened were they applied in direct contact with the leaf of the first spring in the usual manner. This peculiar triple-spring is a recently patented arrangement, for which

Fig. 3. Lorraine Air-Start Diagram. The air cylinder, 3½ inches diameter, has a cupped leather piston fixt to a rack engaging a pinion, one-way clutched to the line shaft; this starting pinion is located close in front of the gear box and the driver's foot-board. The rack is under the starting pinion, and is held up to the pinion engagement by a roller underneath. The rack is surrounded by a helical spring which returns it, and the pinion and piston, after making a working stroke. The piston three-way valve is shown in section at the left, in intake position, the compressed air being piped to the valve at I. When the piston moves to the right it turns the crank shaft by means of the rack and pinion, R and P, until the rack stud S moves the valve linkage and valve so that the valve right side moves upward 90 degrees, cutting off the compressed air supply to the starting cylinder and opening the cylinder to the exhaust passage E, when the helical spring returns the air piston to the position shown in the diagram, where it remains until the three-way air valve is turned by the driver to give compressed air to the starting cylinder and cause the starting piston to make another working stroke. The air tank holds air enough to give several starting piston strokes with an initial 60 pounds tank pressure. The air pressure gage on the front board informs the driver as to the air tank pressure so that the air compressor can be started and stopped as may be needful. Air from the tank can be used to inflate the tires.

new advantages are claimed. Since it is not intended that the coiled springs should ever close so that the coils touch each other, it is evident that the coiled spring resistance or supporting power must be suitably proportioned to that of the principal flat spring, and the coiled spring tension also has a fundamental relation to the extension of the second flat spring. The action of this triple spring is very easy on good roads and the total spring resistance is rapidly increased by the tension of the second flat spring due to the bell-crank leverage increase as the first, or longer, flat spring yields to the load so that this triple spring is claimed to have more total resistance to closing than an equal weight of spring in ordinary form, and this triple spring is also said to toss the car much less than an ordinary half-elliptic spring of the same total resistance or load supporting capacity.

THE LORRAINE ELECTRIC LIGHTING.

This is a recent Chicago invention, in which a peculiar armature winding is employed in a small dynamo, gear driven from the motor, so that the dynamo always has a positive drive. This gear-driven dynamo is certain to be operative because the gear turns it when the motor runs. It is asserted that the armature winding is such as to make it possible to thus gear the motor and dynamo together, giving the dynamo large speed variations, and yet obtain a satisfactory lamp-lighting current. About 170 Chicago cars have been fitted with this new electric lighting system, patents applied for, which is not yet ready for detailed description. The inventor of this electric lighting, which is, of course, readily controlled from the driver's seat, said that it had been fitted to only some seven or eight cars in New York city, and that the first cost was about $80.00, or something like twice the cost of an acetylene lighting plant; the operating costs of this electric lighting are, however, much less than those of acetylene lighting, being limited to rare replacements, while the convenience and self-generation of the lighting agent are vastly in favor of the gear-driven dynamo car-lighting equipment.

R. E. Hardy Co., 86 Watts street, New York City, is making a special style of the No. 4A "Sta Rite" spark plug. The new style is for use with magneto and has four grounded points to which the spark may jump from the central electrode.

Fig. 4. Hobbs' Elastic Propeller Shaft. This is an annular arrangement of 24 steel rods, each 5-16 diameter, spaced close together and retained at each end in grooved hubs. The rod ends are forged three-cornered, all 60 degree angles so that when the rods are clamped in the notched hub disks by the screw adjusted, 4-piece clamps as shown, twisting the assemblage of rods bodily also twists each rod individually. The torsion of the 24 steel rods is sufficient to transmit a powerful torque, but to limit this torsion, solid jaw clutch members are introduced, having 22½ degrees of jaw clearance, which is the limit of spring driving in this arrangement. The effect of this peculiar elastic shaft is exactly the same as the ordinary 2-spider drive with coiled springs between the spider arm ends, and the operation, of course, lessens the effects of road obstacle shock on the transmission elements.

The Studebaker Bros. Mfg. Co. exhibit of automobiles, street sprinklers, garbage and dump wagons, contractor's wagons and trucks at the Jamestown Exposition was awarded a diploma and gold medal for vehicles.

he past, for the coming season, by ding a well-hung racy roadster of 35 P. which will take the place of the -known Dragon runabout heretofore

1908 Dragon Roadster. This new model takes the place of the conventional type of roadster eviously marketed. It carries a 4-cylinder, 4½x4½ motor, of 35 H. P., cylinders cast in pairs h valves on one side. A cone clutch is used and a progressive change speed gear with two eds ahead and one reverse is mounted on ball bearings, and its case is integral with the rear e housing; wheel base, 96 inches; tires, 32x3½ inches, brakes metal to metal, internal and ernal on the rear hubs. The car has 10½ inches clearance. With gas lamps, tail lamp, horn, ls, etc., it sells for $1850.

luced by the Philadelphia factory. A ned edition of the standard touring car 907 will also be marketed for the com- season. Its price has been increased , being now $2100.00.

ne new Dragon product has a wheel of 96 inches and a clearance of 10½ es. It will seat two, no rumble seat g supplied, but in its place will be a ndrical gasoline tank. The entire ap- rance of the roadster will be that of a fortable and speedy little car for ngth and easy handling. The engine four cylinders of 4½-inch stroke and same bore cast in pairs with the valves ne side. The change speed gear is of progressive type with only two speeds ward in addition to the reverse and is ted on the rear axle and mounted on bearings. The frame is of drop pat- prest steel and the brakes are metal netal internal and external on drums he rear wheels. Thirty-two-inch wheels used, with ten spokes on the front els and twelve on the rear. The body f prest steel and the hood is prolonged nake a curved dash reaching around to seats on the side.

he new runabout weighs 1000 pounds the stock color is red. The wheel base 6 inches. The ignition is jump spark n storage batteries and lubrication is

of seamless steel rings for chucks, gear blanks, pails, poles, etc. The rings ar made from bessemer, open hearth, o crucible steel, copper, brass and bronz

stock, rolled and welded by electricity. B means of the electric welding proces every particle of steel is joined togethe making a perfect uniform joint of soli stock, and therefore, better adapting it fo gear work. Special rings can be furnishe to order from blue prints and specification

Empire Tire Repairing

Empire State Tire Co., 198-200 Terrac street, Buffalo, N. Y., in addition to manu facturing the Greenwald extensible trea tires, tire protectors, and reinforced inne tubes, is also doing a general tire repa business and soliciting work from an point. The Greenwald tires and prote tors were described in the July, 1907, nun ber of the Journal, page 136.

The Empire Company also plan an superintend the instalation of complet tire repair plants for garages and repa shops. Mr. Lemon Greenwald, formerl the head of The Akron Pneumatic Ti Co., and previously superintendent of th factory and branch repair departments o the B. F. Goodrich Co., is superintender of the Empire State Tire Co.

This company's vulcanizers will be de scribed and illustrated in an early issu of the Journal.

Considerations of Motor Car Elements

HUGH DOLNAR.

(The name of the writer of these considerations is well known to our readers as a describer of new cars, and his extended experience as a machine designer and constructor gives value to his deductions and suggestions. Should any of our readers dissent from the conclusions reached in these articles, the columns of the Journal are open to all, in the full belief that free discussion and interchange of opinion is the shortest road to perfection.—Editor.)

The Principles Underlying Magneto Current Generation

The action of the high tension magneto is not commonly well known, and this description, written in ordinary language, is intended to give the reader who is not an electrician a clear understanding of the principles underlying the action of such devices.

PRIMARY CURRENT GENERATION.

If a coil of wire is moved so as to pass close to a permanent magnet, a current of electricity will be generated in the coil of wire, and this electrical impulse can be conducted from the wire coil and turned into heat, light or motion.

The magnets used in magnetos are of horse-shoe shape of steel, permanently magnetized, each of the free ends of the horse-shoe forming a stationary magnetic "field" which is constantly "excited," or in an active electrical condition, coacting with an "armature," which is a soft iron spool wound with coils of insulated wire and mounted on a shaft so that this spool of wire can be revolved and made to pass close to the magnetic fields and thus "cut the lines of magnetic force," constantly passing between the fields. This movement of the armature coil excites or "generates" a "low tension" electrical current in the armature coil, which may be conducted from the coil and made to produce various effects such as light, heat or power.

The low tension current thus produced in a single continuous winding of insulated wire, which may be in several layers about the armature spool, has volume or amperes but has little tension or voltage and cannot jump across a gap between fixt conductors in a way to light a charge in the cylinder of a gas engine, but will produce a useful spark when the armature reaches a certain speed and the previously continuous electrical conductor is broken. This is the "make and break" magneto spark.

The magnetic fields at the two free ends of the horse-shoe magnet are spoken of as "poles," one being "north" and the other "south." In the magneto these poles each occupy, say, one quarter of the circle swept by the armature coil, while one-quarter of the circle is open space between the ends of the fields. This open space between the fields at each of their two ends is spoken of as "the field-gap."

The lines of magnetic force are supposed to be passing constantly from one field to the other and the armature revolution has most generating effect when the armature coil leaves one field and passes thru the gap between the two fields, so that the armature coil receives two distinct and separate or "alternating" electrical impulses in each revolution.

So far this elementary statement refers to the production of the low-tension or primary current only, which can be made to produce a make-and-break, or "hammer," spark, but has not sufficient tension, or "pressure," to enable it to leap over a gap between two fixt electrical conductors.

INDUCING THE SECONDARY, HIGH TENSION, CURRENT.

If the armature has its winding of coarse insulated wire surrounded by a second winding of very much finer wire, insulated so that there is no direct electrical connection between the inner, primary, coil of coarse wire and the outer, secondary, coil of fine wire, there will yet be a current of electricity "induced" in the outer coil when the primary circuit, or current of the primary armature winding is interrupted or broken. This secondary, high tension current has vastily greater pressure or voltage than the primary current and can be used to produce a jump-spark.

It should be said here that there are two distinct jump-spark effects, the one a single, instantaneous, spark leaping across the gap, from one conductor to another, and the "arc-flame" in which the gap is bridged by a continuous hot flame for an appreciable length of time, and that the arc-flame gives a much more certain and rapid charge combustion than the single jump-spark of instantaneous disappearance.

The single jump-spark may be produced by stationary, primary and secondary coils, but the arc-flame can be had only when the secondary coil is wound over the primary coil so as to form a single armature and this armature is revolved between magnetic fields, as described.

TIME OF INTERRUPTION.

An alternating primary current is strongest when the armature coil is passing between the two fields, and if broken at this time induces the strongest current in the secondary winding of the armature, hence the primary current must be interrupted at the time when the armature is passing from one field to the other to produce maximum secondary current effects.

SPEED OF THE ARMATURE.

The generation of current in the primary coil of the magneto is greater as the velocity of the armature is increased, and the greater the current generated by the primary coil the higher the tension of the

Hosted by Google

current induced in the secondary winding.

Hence it is plain, that to make a magneto give sufficient jump-spark when the motor starting-crank is turned slowly, to ignite a charge there should be some device placed between the motor crank-shaft and the magneto armature shaft, which will give the armature a high-speed movement when the coil is passing between the fields, no matter how slowly the motor starting-crank may be turned. This has been but recently done in the Unterberg & Helmle high tension magneto as described elsewhere in this issue.

THE PRIMARY CURRENT SPARK.

To induce the secondary current the primary circuit must be broken, with the possible result of an undesirable spark at the breaking point, and to obviate this difficulty a device called a condenser is used not only in magnetos but also in the ordinary spark coils.

THE CONDENSER.

If the primary coil circuit terminates in a series of sheets or disks of tin-foil, insulated from each other, so as to connect these insulated foil disks in interposed pair, this arrangement of connected pairs of alternated disks, called a "condenser," prevents an injurious spark when the primary circuit is interrupted.

Clutches and Standardization

It is fashionable at this moment to assert that motor cars are now as good as they ever will be, that it is folly on the maker's part to change models every year, and that because of this attained perfection of motor cars the millennium of standardized production is either already here or is soon to begin. The frigid fact is, that at this moment motor cars in good and regular standing which are making real money for their builders and are giving real satisfaction to their buyers and users, are as different from each other in form, materials, mechanical details and minor function as they can possibly be, and yet stand on four wheels and have a general resemblance to each other in outside appearance. From the radiator or mock-radiator in front to the half-elliptic, platform or full elliptic or coiled springs mounted on the tubular or solid, steel or wooden rear axles with bevel-gear or chain-driven rear-wheels, from side doors swinging to front or rear, or no side doors and side levers or no side levers, the 1908 motor cars show every variation conceivable when looked at from front, rear or either side, except three—wheel support on the road surface and front-wheel traction, and when the reflectively perceptive eye of trained mechanical observation is directed to the principal details of the "perfected" 1908 fire-wagons, the diametrically opposed lines of thought and practice in 1908 motor car designs and construction are not less obvious than amazing, nor more evident than indefensible.

On every side and in the middle 1908 motors cars show costly details that are inconvenient and inefficient in one car, and low cost, highly satisfactory and functionally perfect constructions fitted to meet the same demand in another car of the same rank and price.

Granting the need for placing toothed change-gears in a car, the clutch becomes a necessity. The requirements of the clutch are: First—that it should let go, wholly and completely, altogether disconnecting the motor from the wheels instantly, surely and easily, because the quick stop is a matter of life and death in motoring same as in many other pleasure and business functions of humanity. Second—the clutch must hold lightly, very firmly or be little, much, or absolutely locked, as the driver wishes, and must also take hold easy and hold on hard. Third—the clutch should handle easily, with as few foot-pounds of muscle-energy expenditure as may be. Fourth—it should be durable, and last of all it should cost as little as possible, and yet be good and convenient.

And what are the 1908 clutches? Everything, cones, cylinders, external, internal, exterior bands, interior bands and shoes, screw, lever, toggle and motion actuated, self-engaged thru the automatic action of 1000 pounds springs or springs down to 15 or 20 pounds tension or compression, or no springs at all, enclosed or exposed, everything can be found in the 1908 "standardized" motor car clutches.

Speaking of clutch cost, the best clutch of all, in the writers' opinion, does not cost, all told, so much as the four, machine-cut, tool-steel and tempered 1000 pound clutch springs of a 1907 clutch, which the designer thought was the best ever. This best clutch of all has no spring, or a heavy light coiled spring costing only a few cents, as may be thought best by the designer. It is an exterior cylinder for the driving member, integral with the fly-wheel, as large diameter as it can be, and not have any part of the clutch outside of the steel radius. The clutch band is ordinary band iron fibre or leather lined, no finish, simply turned over on itself at each end and riveted, two levers and a sliding cone, pedal-actuated both ways, or light-spring engaged and pedal-disengaged complete the mechanism. The clutch drum, integral with the fly-wheel, costs nothing for material and not more than one cent for finishing. The entire labor cost of this best clutch need not be over 50 cents, overhead charges included, and the total flat cost, labor and materials included, need be no more than dollar and a half.

The action is simply perfection. When released it completely lets go, when the band, leather or fibre lined, begins to touch the clutch-drum the drive begins and increases with band-pressure until, with little engagement power expenditure the clutch holds all the motor can give.

ith offices at Asbury Park, N. J., is a evice for charging batteries, and are parcularly adapted for changing alternating ito direct current. It is an electrolytic ectifier, and altho the principles of its peration are not new, the arrangements or their use are new.

Hickley Alternating Current Rectifier.

The efficiency of electrolytic rectifiers is nproved by the heating of the electrote as the current is increased, thus causng constant attention and necessitating equent changing of the electrodes and ectrolite. In the Hickley rectifier this as been overcome by combining a new ectrolite with a radiating surface, this rface acting as one of the electrodes nd by creating an automatic circulation f the electrolite, keeping it at the temerature of greatest efficiency.

The rectifiers are absolutely automatic use of several aluminum electrodes, pulses of the alternating current are ized, and on this depends the action the rectifiers. For the same reason i impossible for the current to pass but way, consequently there can be no b ing up of the batteries being charged.

Specially prepared aluminum rods used, and the electrolite is a new c pound that gives the highest efficiency is claimed the rectifiers can operate any frequency, from 25 to 133 cycles clusive, and on any commercial alter ing voltage, a range of from 0 to 75 v on 110 volts and from 70 to 145 volts c 220-volt current can be obtained. efficiency of the rectifiers varies with voltage delivered. By tests, it is st the 12 ampere type has given from 75 cent. at less than half load to 85 per c at full load. This will hold good types of larger capacity, the power fa remaining nearly constant for high or voltage charging. The panels are contained, and only require to be nected to the A. C. mains and the l The claims are made for them that t are very flexible, reliable and inexpens and free from two great objections to vices for changing alternating into di current—i.e., constant attention and of up keep. The Hickley rectifier is a g anteed instrument, fully protected United States and foreign patents.

"Raybestos" Brake Lining

The Royal Equipment Co., of Bri port, Conn., manufacturer of automo brakes, was among the pioneers in manufacture of brake linings, and still placing on the market the br lining first produced by them, their " bility" brand, which ranks high and product of merit. The basis of the li is a closely woven duck which is give special treatment, securing the adhe and wearing quality. It has a life of wards of 10,000 miles, and is well ada to the work of light cars and on he cars when the car is not subject to l steep grades in a mountainous countr

To meet the demand for a lining c bining great wearing qualities and at same time resisting the heat necessa generated by the incessant use of brake in descending sharp hills, of a or more in length, the Royal Equipm Company has recently placed on market the "Raybestos" brand of li

Digitized by Google

This year, as in previous years, the entire output of the Elmore factory is pledged and sold—with agents urging an increase of their allotment

Far and away the most active car in the American sales market today is the valveless two-cycle Elmore.

For five years it has been the steadiest selling car in this country.

These are positive effects due to a fixed and positive cause.

The stability and prosperity of the Elmore, past and present, has arisen primarily from the fact that it is a *two-cycle* and a *valveless* car.

The history of all four-cycle cars has been one of change and caprice in public choice—largely due to caprice and change and uncertainty in construction.

The history of the valveless two-cycle Elmore has been one of steady progression and steady popularity due to the gradual evolution of a fixed principle of whose correctness every Elmore owner has been enthusiastically convinced.

Thus, today,—no Elmore owner can be coaxed or coerced away from the Elmore. This is due to the riding and operating results he gets *because* it is valveless; and *because* it is two-cycle.

Owners of four-cycle cars may and do waver in their allegiance, change cars, become discouraged and abandon any and all four-cycle cars—the Elmore owner will remain supremely loyal because he is supremely satisfied.

After the Elmore two-cycle engine was perfected and all valves eliminated, only one thing remained to emphasize and widen the gap between the Elmore and all other cars, to wit: the ignition system.

In the 1908 car has been installed an ignition system substantially as amazing in its results as the action of the two-cycle engine itself—a system, for instance, which will run the car 2000 miles on one set of six-inch dry cells.

The paragraphs give you in the rough some idea why the sales of the Elmore are impervious to changing conditions which affect four-cycle cars—why we are inclined to bend a listening ear to the appeal of our agents that each and all of them be alloted more cars.

CHAS. E. DURYEA

GASOLINE CONSUMPTION AND TIRE MILEAGE.

Schnectady, N. Y.

Will you kindly answer the following question in your columns. I am thinking of purchasing an automobile and would like your advice on the following points. 1. How many miles to the gallon (on average roads) could be expected from the Olds, Maxwell and Ford standard runabouts, assuming the machines to be in proper condition and driven intelligently. 2. How long should tires (the best maker) last on these machines if given proper attention and driven with care. State length of wear in both time and miles. 3. Would solid tires (of the Swinehart type) answer on these machines. How long should these solid tires last?—C. A. WOLFE.

The best way to get information regarding any particular machine is to write to the makers or to users. I do not know by experience the mileage per gallon, but would expect about 20. Much depends on the operator. Many tires are guaranteed to run 5000 miles, and if not overloaded should do twice this. Tires often deteriorate with age so this mileage should be expected the first year. Solid tires wear off on the tread unless very large, and as they wear off they lose their original resiliency and become of less value until they are worn down too much to use. Then they bring very little for scrap. The air tire retains practically its full value as a shock absorber until it will no longer hold air, and is, therefore, the best form; altho for those who do not care to be troubled with air tires and are content with a somewhat less perfect riding tire, the solid will give satisfaction.—C. E. D.

WHAT IS THE TROUBLE?

Philadelphia, Pa.

We have an old single cylinder gasoline auto. We have had nothing but trouble with it. We do not seem to get power enough and would request you, and thank you if you will go through the following data and see if you can find our trouble. The engine is 4-cycle single horizontal cylinder, 4½x5¾; intake opening, 1⅜; exhaust opening, 1⅝; intake valve is automatic and raises at the full opening 5-16-inch; exhaust opens at all times ¾-inch may be a fraction more; into the intake and exhaust are, of course, screwed pipe which we presume are 1-inch and 1¼-inch; carburetor Kingston. The exhaust begins to open about 15 degrees before the dead center and closes at the other dead center. We fire at 15 degrees past dead center to about 10 degrees ahead of dead center. We have no trouble in getting the machine to start. We cannot help but believe that the exhaust does not open enough.—WEST & CO.

The exhaust lift is a trifle small, but this does not affect it except at high speeds, so this is not the trouble. You will understand that at 500 R. P. M., a valve need only lift half as high as where the speed is 1000. Your trouble is probably either with the spark or the mixture. Most likely your batteries are weak and give a few sparks all right, but are unable to continue. When they rest a few moments they will spark all right, but run down almost immediately. If the fault is not there, it might be in the carburetor. A bit of dirt on the needle will make a lot of worry. Possibly the mixture is too rich so that it misses fire when hot, altho it starts easily when cold. Look to the timer contact and make sure that it has not moved on the shaft and is giving the spark at the wrong time; also test your compression, if very weak you may have a scored cylinder, due to a broken ring or loose wrist pin. The engine should develop about 8 H. P.—C. E. D.

ABOUT GAS TURBINES.

Indianapolis, Ind.

I n ticed in the April number of The Cycle and Automobile journal, where you refered to Cassier's magazine for a description of gasoline turbines; that you said that you had built one. Now, I would like to have all the information on the subject that I can get. Would you please tell me where I can get that magazine? Also your opinion of their weak points. Any information that you may give me will be highly appreciated.—WILLIS E. LA RUE.

Any news stand will order the magazine for you, or you can see it at almost any public library. The weak point of the gas turbine is the high heat of the gases, and the fact that this heat simply increases the speed of the gas instead of increasing the weight. High pressure steam is more dense than low strikes the turbine blades a harder blow than pressure steam, and so has more weight and

Hosted by Google

does low pressure steam, both because of this density and because of the higher speed. With the gas the high temperature increases the pressure, but no additional matter being added, the density does not increase but rather decreases, and so it does not strike the blades so hard as steam. Further, steam yields a vast amount of heat before turning to water and so can be utilized at slightly over 212 degrees with little likelihood of its falling lower or turning to water, but gas loses its heat without limit and falls in temperature and efficiency rapidly. The heat arrangement will doubtless be a combination of the two using steam to prevent excess of temperature and add weight and efficiency to the gas. Or it may be possible to add weight by letting the hot gas act on solid particles like air on sand for sand-blasting and utilize the impact, but this method is questionable. —C. E. D.

WANTS TO USE FOUR AIR-COOLED MOTOR CYCLE MOTOR CYLINDERS.

Chelsea.

Will you kindly answer me the following questions? I am building a 4-cylinder air-cooled motor, 2¾ bore by 3¼ stroke, the writer has built several of these motors for motor cycles and has had fine success; what I would like to know is this, by putting four of them together and putting them in my runabout with the use of two fans, in your opinion will they overheat? One man especially, claims that four of them would overheat so I could not possible run. What success do the Franklin and the Marmon people have. Kindly advise me or give me any instructions or information, same will be appreciated by a constant reader of The Trade Journal.—JOHN W. WOOD.

You will have no trouble with cylinders of the size you mention if they are designed and made in good shape. They should be regular in shape so that in expanding they do not warp out of round, and the rings should fit well and so hold the gases perfectly for the escape of the gases not only causes loss of power, but leaves the heat of the gases in the cylinder walls and also blows away the oil, with the result that the friction heats the walls rapidly. Get a good oil if you have trouble at first. The air-cooled motor is sure to win out for it has less parts and altho not so constant or regular in its working conditions and, therefore, likely to require a little greater care, is perfectly practical and may be more economical than a water-cooled.—C. E. D.

HOW TO RESTORE TRANSPARENCY TO SCRATCHED CELLULOID.

St. Joseph, Mo.

The fiberloid in the drop to the front of the top of my car has rubbed so that the surface is not as transparent as it should be. Can you tell me how to benefit it?—S. D. WESTHEIMER.

The best way is to get a new piece of celluloid. It can usually be supplied by carriage makers, and is often kept by stationery and novelty dealers. A celluloid varnish will partly restore the surface. Any varnish house can supply you with the transparent varnish or lacquer used to protect bright metal, and this will largely smooth out the rough scratches and permit the light to pass thru without distortion. Have it very thin and use a very fine brush or flow it over the surface.—C. E. D.

WOULD INCREASE THE POWER BUT BE WASTEFUL.

I am applying for a patent on an improvement on the 2 cylinder opposed 4 cycle type of gasoline motor and I would like to have your opinion of it through the columns of the Journal. In my motor the mixture is drawn first into the crank case through one ordinary suction valve by the spreading of the pistons. It is then forced into the cylinders alternately through automatically operated valves placed in the heads of the pistons. If the crank case is made as small as possible, the compression stroke will start with almo s twice the amount of mixture in the cylinder of an ordinary motor of this type. This arrangement will permit a larger explosion chamber and still keep the compression up to the proper point, thereby making a much more powerful motor with fewer moving parts and the same piston travel as in other types. Would I get more power with this motor and if so about what per cent?

Would not the intake valve momentum be about the same as the momentum of the pistons and mixture? What is the reason that an automatically operated intake valve is'nt as efficient at high speeds as a mechanically operated valve?—W. E. R.

Your plan is not broadly new as you have doubtless learned from the Patent Office. You can get double the amount of mixture into such an engine by that method but you cannot use it economically and this is the weak point. You begin the working stroke with the usual pressure but with twice the quantity of gas which you must exhaust at a single stroke length instead of expanding it to double stroke length as such double quantity should be expanded. It would be powerful, for the pressure is high and would fall but little but the exhaust would be very noisy. This arrangement for emergencies when great power is needed would be fine, but this makes a lot of complication. At a guess I would say that you would get 60% more power but you would burn double the fuel to do this and so be quite wasteful.

The intake valve in the piston could be balanced or placed crosswise, but if made very light it would open all right. While its inertia would be the same as the inertia of an equal weight of the piston it must be lifted by the mixture but the piston is returned by the flywheel. Just at the dead center it would lift freely but the piston would quickly be forced against it.

It is assumed that the inlet valve offers too much resistance to the incoming charge at high speeds if automatic and in the craze for high speed all other considerations have been sacrificed. I favor a light suction operated inlet and feel sure it will meet all legal requirements in a superior manner.—C. E. D.

CALCULATING THE SPEED

BRIDGEPORT, CONN.

Will you kindly give me the speed per hour a car should make engine revolution 1000, or what speed the engine would have to travel for a speed of 35 miles per hour, ratio of car 4 to 1, 31 inch wheels. Also if four cylinders, 4x4, is not ample enough to handle a car weighing 2,100, geared at this ratio, 4 to 1.—CHARLES H. SHANNON.

Easy problems like this you can figure out for your self and be more able to handle the next one, for practice makes perfect. A 31 inch wheel rolls 8 ft. per revolution. This is not the absolute theoretical distance but it is easier to handle and is more nearly correct than the exact figure which is slightly larger, because a drive wheel always slips some. Second the the answer to such a problem is almost always only an approximation and it is needless to carry fractions. 5280 divided by 8 equals 660 which is the number of revolutions per mile. At 35 m. per hr. the car will travel $\frac{1}{60}$th of 35 mi. or $\frac{7}{12}$th m. in a min; and $\frac{7}{12}$th of 660 equals 385 which is the number of wheel revolutions per min. The engine makes four times this or 1540. I doubt if your engine can easily do this and would advise a higher gear for this speed, say 3 to 1. At 1,000 revolutions of the engine the car would do slightly under $\frac{2}{3}$ of 35 m. or about 23 m. per hr.—C. E. D

ROTARY GAS ENGINE VALVES

ROCHESTER, N. Y.

I wish Mr. Duryea would tell us of his experience with the rotary valves which were described early last year. It seems to me that the construction was better than poppet valves and I would be interested in knowing if practical test and use have proved that.—W. H. BOARDMAN.

Not many of the rotary valves were made for reasons not connected with the valve. On this account the experience was not so complete as could have been wished. I had very little time to stand over the experimental work and it is usually true that a workman will produce the result he is expecting, so I had difficulty getting the men to see how to make the rotary valves better, simply because they did not believe they could be good. For example I have had them report that "the valve leaked and there was no compression" when a few drops of oil on both valve and bushing showed the valve to be tight and the leak around the bushing. We were not fixed to

Hosted by Google

properly fit the hole in the cylinder to the valve seats or bushings and had most of our trouble there. They either leaked around the bushing or in clamping the bushing in place the valve was caused to run hard. In spite of these difficulties, they were carried up to a point where they developed as much power per cylinder as some well known engines of the poppet valve type are doing to day and the better they got the more confidence the workmen had, with consequently more rapid improvement. Such a statement seems silly but it is what often happens when one is not pretty closely on the job himself.

They were as quiet as a steamer and gave no difficulty from lack of cooling or lubrication. I look to see them used more in future. The speed was very slow and once fitted properly and made of proper material there would seem to be no reason why they should wear out in any reasonable length of time.—C. E. D.

MATERIALS USED IN COILS

Will you please answer the following questions in the next issue of the Cycle & Auto. Trade Journal.

Is either primary or secondary winding of a spark coil magnet wire?

What are the best materials for insulating between the layers of the secondary winding?

I have been a subscriber for about two years.—GEORGE PAPE.

Magnet wire is used for both coils. The primary coil is usually wound with cotton covered but will be smaller if silk covered wire is used. The secondary wire is usually silk covered but I believe some makers simply varnish it and others wind a thread between the wires which holds them apart.

Paper waxed with paraffin (not grease or butter), is usually placed between the layers. It is common not to wind the secondary in one coil but to make two or more spools of it and separate them by mica or any similarly good insulator.—C. E. D.

NO ADVANTAGE IN AIR COOLING FOR MARINE MOTOR

NEW YORK, N. Y.

Would you mind informing me through the columns of the C. & A. T. Journal the reason why air cooled motors are not considered serviceable for marine work—if there is a good reason?

If in your opinion air cooled motors are adapted for marine work what special precautions should be taken with regard to the care of a 4 cyl. 4 cycle? Are the valve springs liable to rust and deteriorate more rapidly with an air cooled motor subject to great heat and all air? Must lubrication be more free than with water cooled? Would an air cooled if used be disadvantageously placed under a closed hood? Is a pan absolutely necessary? Would a dash of spray consequent upon shipping a sea crack cylinders when running at top speed?

Suppose on a speed hull any regular light weight water cooled 4 cyl. 4 cycle 4½x5 motor developing its power at 1,000 R P M were to be installed and a choice were given of a 4 cyl 2 cycle 4¼x4½ air cooled motor developing its H. P. at 1,000—(in addition the air cooled 100 to 120 lbs. lighter) which would be the most advantageous and which develop the greater power and in what proportion? Or, would you recommend a 3 cyl. air cooled, same bore and stroke.

I am presuming an answer favorable to air cooled, probably because I am aware of your contention that a gasoline motor is a heat engine.

Motor work however, on the sea and somewhat exposed is a problem differing from automobile practice. Your opinion and expressions regarding air cooled for marine work from a practical point of view would be valuable.—F. W.

Water has great heat absorbing qualities. As it changes into steam it absorbs 5½ times as much heat as would be used to raise it from freezing to boiling and yet the steam is no hotter than the water. On this account a wide variation of conditions may take place without any complaint that the engine overheats. And in this sense water is a much better cooler than is air. Makers are anxious to avoid trouble and even users are not particular so long as they get along somehow, so the water cooled motor gets the preference. But the fact that thousands of aircooled motors are in use every day of the year and that some of them are doing any stunt that the watered motor does, proves that when they are right and kept so, there is no objection to them. This means tight piston rings, proper lubrication, proper mixture and no unnecessary overloads; all of which should be looked out for with the water-cooled motor but often are not. For marine use however, the water is handy and it seems wise to use it. Nothing is gained by using air instead. There need be no valve spring trouble. If a spiral spring softens at its ends and gets shorter, use a shear spring. I have used these in places where a red hot abutment would soften a helical spring every time. An air-cooled motor should be exposed to the air and being down in a hull or cock-pit, most air-cooled motors would require a fan which is bigger and just as troublesome as a pump. I do not think a splash of water would hurt an aircooled motor but if the cylinder was so shaped that it was under a stress the sudden additional strain might break it. Cast iron sometimes cracks with very little provocation.

Of the two motors quoted I would expect to get the most power of the 2-cycle and given an equal choice I would favor it. The 2-cycle has not been developed so fully as has the 4-cycle so very often falls short of its intended power. Four cylinders will give more power than three of the same size and I must not be misunderstood in my preferences. For the average family 20 H P is enuf auto power and three cylinders of the 4-cycle type will give this with less parts and cost than more. Eventually when the 2-cycle is to be depended upon with the same reliability, two cylinders will be enuf. This is not saying that for racing speeds or special purposes or for boat work this number should not be exceeded. The same explanation holds with reference to the method of cooling. In auto work the heat must go to the air and it looks right to get rid of it directly instead of thru a lot of piping with water and a radiator. The simplest way usually survives provided it does the same or nearly the same work as a more complex way. I fully believe that the final form of auto motor will be air-cooled.

I also believe that heat should not be carried off thru the walls of the cylinder needlessly; but it does not follow that an air cooler is hotter than a water cooler. To make sure that there is no trouble in extreme cases the maker usually provides more air and cooling capacity than is needed with the result that very often the air cooler runs less hot than its water cooled brother.

To better illustrate my faith in both air cooling, and the 2 cycle I will say that the motor buggies I am now building are both air cooled and 2-cycle.—C. E. D.

OILLESS BUSHINGS.

BUTTE, MONTANA.

Kindly inform me though the Cycle & Automobile Trade Journal how to re-graphite the bushings on Duryea transmission. Oil splashed out of crank case and dissolved out the graphite that was originally there.—O. A. T.

The oilless bushings used in the Duryea transmissions are fitted with plugs specially prepared by the N. A. Metaline Co of Long Island City, N. Y. You can get from them full information with prices. I have used this method of lubrication for probably 15 yrs. in auto work and it has the advantage that it is clean and permanent. It requires no attention but does not run quite so free from friction as an oil bearing. This is of little moment in a light vehicle with plenty of power particularly when those bearings were only used occassionally.—C. E. D.

An appeal is being made by the American Automobile Association to have the retail dealers throughout the country lend their support to the Federal bill requiring uniform laws in the various states. The effort to put such a bill through Congress enlists the sympathy of all motorists and those having no club affiliations should support the national body by taking out an individual membership for $2. Particulars concerning the Federal bill and membership privileges can be had from Secretary F. H. Elliott, 437 Fifth Ave., New York.

Work on the Long Island Motor Parkway has been progressing quietly, but the signs of activity have been more apparent of late. A plot of ground was purchased recently and the contract awarded for erecting an administration building at Mineola and the engineers are now engaging for the actual work of construction which will be begun very early in the spring.

REMEDYING LOOSE BEARINGS

DONIPHAN, NEB.

I have a 5x7 opposed engine that has given me lots of trouble all summer. It seems almost impossible to keep the connecting rod bearings tight, seem to pound loose, have tried all kinds of babbitt some as high as 50c. per lb. I very carefully tinned the connecting rods before running the metal but it was no

Hosted by Google

good, after running 100 miles would have to take down bearings and adjust them, and in a very little while they would be loose again.

It seems to me that the 7″ stroke is too long for the speed of the engine. I have not tried a pressure gauge on the cylinders but it is almost impossible to pull the engine over. The cylinders have the valves both in the head and the compression space is 1⅝″. What would you advise me to do? Don't you think I would get about as much average power if I was to put in a 6″ crank shaft and have a smoother running engine? Could I use the same connecting rods and have a little lower compression if I was satisfied with a little less power? It seems to me that the engine with 6″ stroke could be run enough faster to make up for the less piston travel and what difference there would be in the compression stroke or would that figure anything. I would like to use a storage battery but as we have no way close here to have it charged could I rig up some wet cells and charge the storage battery at night if so what style battery would you advise me to get Salamoniac or Sulphuric Acid? I would prefer the Salamoniac if they will do the work. How many would I have to have?—HARRY WILSON.

You do not give the size of bearings so I do not know what to say about that important point. If the crank pin is not parallel with the shaft your bearing is on one edge at a time and will wear out fast. If your crank shaft is weak enuf to spring or is sprung it will give this effect. A lower compression ought to help it. You can put on a temporary addition to the compression space by screwing a gas pipe T into the spark hole with the plug at the side of the T and a piece of pipe on the end. If this pipe is large and short it will give a big chamber and yet not take a lot of room. You can get at the effect of lower compression by this method and so decide whether to make a change in the position of the piston. To change the crank is costly and reduces the power because it reduces the amount of new mixture drawn in. It is better to use a shorter connecting rod and usually much cheaper. This will reduce the compression but use the same quantity of mixture and so keep the same or nearly the same power. You may be able to save the bearings by using a loose bushing in the place of the babbitt. This bushing will turn about half as fast as the crank pin and so reduce the speed and wearing effect. I have saved bad bearings by snapping a bracelet of very thin spring steel around the crank pin. This was not true in shape but it worked. Be sure there is no grit in the crank case and use a heavy oil so that it has some body when hot. A very little graphite will often help.

You can charge a storage cell very nicely by the use of wet cells. The salamoniac cells will do the work all right. Set up enuf wet cells to give a voltage greater than the voltage of the storage cell. Then connect like terminals together and the increast pressure of the wet cells will force the electricity back thru the storage cell and restore it to the charged condition. The rate depends on the difference in pressure and by putting in or taking out a wet cell you can arrange to recharge at a slow rate which will not hurt your wet cells much and yet will fill the storage if left connected over night. You ought to have a volt meter for this work but if you have not you can count salamoniac cells at ¾ volt each and caustic soda cells at ½ volt each, so for a 4 volt storage you would need 8 to 10 of one or 10 to 12 of the other. C. E. D.

REBORE OR REGRIND?

NEWARK, N. J.

I have removed both cyls. from my opposed engine for examination as they have been in constant use for nearly three years. Before dismantling, the compression (when cranking) did not seem to be as good as it should be so I concluded reboring and new pistons would be necessary. However, I now find that the cylinders show no perceptible wear (using a caliper) but are not perfectly smooth on the inside. The piston rings seem to be slightly worn.

It does not seem to me that reboring is necessary but I want to get the maximum efficiency out of the engine and do not want to re-assemble it without having everything right.

Now, would it be alright to have both cylinders ground, only to a perfectly smooth finish and put in new piston rings? If not what is the best thing to do? Bore is now 4¼″, stroke 5″.—THOMAS E. DENTON.

I do not see that I can advise intelligently. If the roughness is deep it will make the cylinder larger to grind it out. New rings will fit the cyl. but if the piston is too loose the rings cannot hold the gases because as the piston moves from one side of the cylinder to the other the rings are forced into the bottom of their grooves and do not get out quick enuf to avoid leak. If the cylinder walls need work I would advise a larger piston and new rings. If there is not much wrong, I would put in new rings only.—C. E. D.

WILL ACETONE CLEAN CYLINDERS?

Will you kindly give me any imformation you may have on the use of acetone, a chemical said to be the only thing for cleaning carbon out of automobile cylinders without taking engine down and scraping, in other words it is said to be the greatest solvent of carbon known. Would like to know if it should be mixed with oil or any other liquid also what quanity to use. Would also like to know where exhaust valves on 1903 Franklin should open and close, also if possible at what speed of car, air valve on Schebler carburetter should start to open? Have Franklin with one of these carburetters on and don't seem to be able to set air valves so it will work properly at all speeds.—W. R. WICKE.

I have been unable to learn anything about acetone as a solvent of carbon. It is my understanding that the carbon particles themselves are not soluble in any known solvent but it does not follow that we may not find such a solvent some day, nor does it follow that it is necessary to dissolve the carbon in order to clean the cylinder. If the binder that holds the particles together can be dissolved, this should do the work. I imagine that in most cases the particles immediately in contact with the cylinder wall are not burned much unless the wall has been red hot and on this account acetone or any good solvent can get under the real carbon and loosen it by dissolving the oil which holds it to the wall. Kerosene is good for this purpose. There is a decarbonizer on the market that I have heard recommneded by those who have used it.

Acetone is a combustible organic liquid much used for dissolving difficult fats, etc, but its principle use in connection with auto work is as an absorbent of acetylene gas. A tank half full of acetone will take ten times as much acetylene as it would at the same pressure without. Acetylene at such pressures is liable to detonate if separated from the acetone so the tank is first filled with some asbestos or other absorbent of acetone which overcomes this danger. This is certainly an aggregation but it illustrates how difficulties are overcome. Acetone boils at 56 degrees Centigrade, about 133 degrees F.—C. E. D.

ANTI-FREEZING SOLUTION QUERIES

WAYNOKA, OKLAHOMA.

As I have been a reader of your Journal for some years I would like you to answer the following question, thru the Journal.

Can denatured alcohol be used for anti-freezing solution the same as wood alcohol? Is it as safe from explosion? In what proportion should it be used?—G. F. GREEN.

ROCHESTER, N. Y.

Being a subscriber to the Cycle & Automobile Trade Journal, would like you to give me the formula to prevent cooling water on a gas engine from freezing, and about what it will cost.

I have a single cylinder engine in a shop in the yard and use ¾ iron pipe between the engine and barrel, which holds about 17 gallons of water. The only time when the shop will be warm is in the evenings and on Sundays. I would like the formula so made that when mixed with the cooling water it will not freeze in zero weather, nor freeze in the pipes and the pump. I suffered once from cracked cylinders caused by freezing and do not want the same thing over again.

Please state about what the H. P. will be from a four cylinder, four cycle motor, with 3¾″ bore and 3¼″ stroke, with 1½″ valves with ¼″ lift at 400 R. P. M. and at 800 R. P. M. If you have any idea as to what amount of gasoline the engine will consume at the above speeds for 1 hour would be pleased to hear of it.—CLARENCE W. HEFNER.

MONTMORENCI, IND.

What is the best prescription you have for an Anti-Freezing Solution.—HARRY W. STYNER.

Denatured alcohol is now so cheap that I imagine it will go to the front this winter as a preventative of freezing. It will not get gummy like glycerine nor crystalize or attack metal as calcium chloride will sometimes do. On the other hand it does not stand so low a temperature as does the other solution so if the cold is likely to be intense it may be safest to stick to the calcium chloride.

Hosted by Google

25% alcohol and 75% water freezes at 0° F.
35% alcohol and 65% water freezes at 15 below 0° F.
40% alcohol and 60% water freezes at 25 below 0° F.
20% alcohol, 20% glycerine and 60% water at 25° below.
Calcium chloride, 5 lbs. to a gallon of water, at 35 below 0°.

A good way to use the latter is to make a saturated solution and then use equal parts of this and water. It will stand down to 0° or below and if it freezes, the ice is mushy and not likely to do damage. If the water boils furiously there is some escape of alcohol vapor and some care should be used to make sure that the proportion of alcohol does not get too little. I think there is no danger of an escape of vapor fast enuf to get a fire or an explosion. In regard to Mr. Hefner's engine will say that as auto engines vary so widely in their fuelconsumption it is not safe to guess what yours will require. Your engine should give 10 H P on a gallon and a half of fuel per hour at 800 rev's and half that with slightly increased rate of fuel consumption at the half speed.—C. E. D.

2 Cycle Engines

HUGH DOLNAR.

NO ADVANTAGE IN USING SLOTTED CROSS-HEAD.

Is the slotted cross-head a practicable means of converting reciprocating to rotary motion for a pair of opposed cylinders? If not, what are the principal objections? While I have no mechanical training, I am intensely interested in the gas engine.—C. M. J.

The slotted cross-head is "practicable" in this connection, but it is by no means suitable. With opposed cylinders having pistons connected to cranks at 180 degrees, the linkage is in standing and running balance, because the pistons move toward or from the center equally. With the slotted cross-head linkage, the pistons and cross-head move all together in one direction giving an unbalanced mass travel, which would cause prohibitive vibration at ordinary speeds. At best the slotted cross-head is fit for only slow work, and it is always costly, difficult to maintain and takes up much more room than the connecting rod linkage for the same piston stroke.

At one time English engineers favored the slot at large, but it is now rearely used save for very slow movements. The slotted cross-head is wholly unfit for the use specified.—H. D.

A CRITICISM.

New York, N. Y.

Although not a subscriber to your interesting paper, I generally manage to read the same with a great deal of enjoyment every month as it comes out, and wish to express my surprise at the evident sarcasm in Mr. Hugh Dolnar's reply to John P. Bates' letter regarding the horse-power of an opposed motor on page 90 of your December issue.

Mr. Dolnar says: "It takes 2 cylinders to make an opposed motor, consequently . . . if you mean a pair of opposed cylinders . . . , as I guess you do mean, etc."

It seems to me that this takes for granted a knowledge of technical terms on the part of the public which many of the talent in the automobile business do not possess themselves, and is unnecessarily severe on Mr. Bates.

On running over the pages of your interesting magazine, I notice on page 4 an advertisement of the "Auburn." This, I see, is described as a two-cylinder "double opposed" 5¼x5. On page 157 I see that the "Reeves" is described as "10 B. H. P., 4x4 "double opposed air-cooled." On page 245 the "De Tamble" is described as "two cylinders, 4x4, "double opposed." On page 375 I note that the "Beilfuss" has "double opposed" cylinders. Of course, these are all extracts from advertisements, which I presume you do not read very carefully, but it gave me pain indeed on reading your description of the "Reeves" engine on page 230, an article evidently written in your own office for the public to read, that "the engine employed is 10 H. P. "double opposed, etc.," with a picture of a two-cylinder air-cooled motor accompanying the text. In view of this, I do not think that Mr. Dolnar has any right to give a public call to a man seeking information for errors you make yourselves."—LANE K. STONE.

[We are pleased to publish the above criticism as we feel that it is particularly true in regard to the pre-supposed knowledge of terms possessed by our correspondents, and furthermore, do not entirely agree with Mr. Dolnar's statement of the case. The term "double-opposed motor" is commonly used to designate a two-cylinder motor of the opposed type and is, without doubt, a contraction of the original term "double-cylinder opposted motor," the word "cylinder" simply being dropped as understood or superfluous, and is, therefore, not an incorrect apellation, altho "two-cylinder opposed motor" is more explicit. In the same way "double opposed motor" has been furtner abbreviated to "opposed motor," and this term is commonly taken to mean a two-cylinder motor, which is evidently what Mr. Dolnar understands by it, altho an opposed motor may have two, four or any even number of cylinders. When four cylinders are meant, it is customary to state the fact by saying "4-cylinders opposed, motor," or as has been done by some makers of such engines, the term "quadruplex opposed motor" is used. The very prevalent use of the designation "double opposed motor" by our advertisers, shows clearly the accepted meaning of the term.—Ed.]

Difficulties Successfully Overcome by Users

Under the above heading we will be pleased to publish how *you* solved *your* automobile difficulties. Many troubles have been successfully overcome by means of the answers in these columns. We earnestly urge those who have been thus benefited or any who have overcome such difficulties to send a brief account of the same to the Editorial Department of the Cycle and Automobile Trade Journal.

SUGGESTION FOR ELECTRIC TRUCK CONTROLLER.

Galen Hall Co., of Atlantic City, N. J., which use electric trucks, suggests the following as an improvement in controllers.

"We believe that a great improvement might be made in electric controllers for automobiles. Our controller has 3 speeds forward and one backward. Getting the control lever exactly at the proper notch is a matter of practice and judgment, and if not properly done the contacts burn or "arc." The work could be done much better if there was less extended motion required, and control effected by a device more instantly at hand, and more conveniently situated. A "Perkins'" wall switch works like a charm in house lighting, and why a switch-board with push button spring escapements could not be devised in this age of electric ingenuity, is not clear to us. Of course, there are several contact points for each speed. Why

Hosted by Google

could they not be arranged in "gangs?" They would also have to be locked on reverse when any of the forward points were depressed, or in 'contact.'

"Will take a new controller for each of our machines in exchange for the idea."—GALEN HALL COMPANY, S. NUISELL.

[We shall be pleased to publish in this department any communications which throw light upon this subject.—Ed.]

HAS USED KEROSENE BURNER TWO YEARS.

Effingham, N. H.

Some time since, the editor of a journal said (in substance) in answering an inquiry as to the relative merits of gasoline and kerosene as auto fuels: "Gasoline is easier vaporized, more cleanly, and will probably give less trouble." Perhaps no clearer or fairer statement has been given of the subject, as far as its general use is concerned. One of the largest oil companies wrote me that kerosene had never been successfully used and probably never would be as an auto fuel. Now I have been using it since 1905, and several of my acquaintances a year or two longer, and no one of us would for a moment think of changing for any of the other fuels. The question arises, if it has given in our experience such success, why has it not won its way into general favor? I will give a few of the many reasons as they impress me.

First, the makers of good burners have not been full and explicit enough in their directions, have failed to impress the ordinary user with the importance of following directions.

Second, it has been assumed that users have made a study of the rather complex problem and understand it. The answer of the editor tells the rest. Now if the user will spend a day or two at the makers of any of the good burners, and have the whole subject gone over, get some practical knowledge of the burner, of what to avoid as well as what to perform, and will then use care, intelligence and caution, kerosene will be found a cheaper, safer and more satisfactory fuel than the others in general use. If, however, the user assumes that because he understands a gasoline burner, that he is a past master with so simple a fluid as kerosene, and that he can handle it "any old way," he will find he has been dreaming, and probably awaken suddenly and condemn the fuel. I do not write to exploit any burner. I do not have the slightest primary interest in any one, nor do I know by experience who makes the best, but from comparing those used with gasoline find they do not suffer in efficiency, economy or safety.

To one contemplating buying a kerosene burner I would say I would never trust to one lighting apparatus on extended trips. Have found that the beginner has most of his trouble in his first firings, and tho he may have the very best torch and use it with care, there are times when it is a great benefit to supplement it and make assurance thoroly sure with another good device. When running give care to the pilot, and see that it is burning well and the gage on the main fuel line clean, and the pressure at the points best suited for the work, and then a little study and experience will give results that will be gratifying and repay any one for their study and care.—H. W. HARMON.

SUGGESTIONS TO H. N. CROSS, M. D.

Mountain View, Cal.

If H. N. Cross, M. D., of Stockton, will change his four-cylinder two-cycle engine ports to the following dimensions he will get all the speed and power he can wish for. Exhaust port, ⅞-inch long;inlet port, ½-inch long; inlet to crank case, ⅞-inch long; piston, 5 inches long, "to come to top of crank case port;" connecting rod, 8½ inches C. to C. He does not show nor state how his crank pins are set, but they should be 90 degrees apart.

Deflection on top of piston should be 1¼-inch high, and on the edges clear the cylinder wall .004 of an inch. Passage for gas from crank case to combustion chamber should have a clear 2-inch area. He has too much space in crank case. Should have at least 5 pounds pressure.—T. J. HENDERSON, M. E.

A PRACTICAL HOOD CATCH.

The careful motorist dislikes to see the highly polished hood becoming scratched when folded back, but very few hoods are so arranged that they will not be marred, after continual opening. In the accompanying cut

is shown a simple device which will prevent this. It consists as shown simply of a heavy strap passed thru two small cleats riveted to the two parts of the hood.

LAYING UP STORAGE BATTERIES.

In laying up storage batteries for any length of time care should be taken to thoroly pour off all the acid, letting the cells drain at least ten minutes. Then fill the cells with clear water, rain water preferred, and then let this after a few minutes drain off. Then fill the cells with distilled water until the plates are completely covered. Clean and oil the connections and screw in the vent caps. The battery should not be exposed to very great temperature fluctuations.

When wanted for use again electrolyte should be prepared as follows: In a clean porcelain or earthenware vessel place distilled water in the proportion of three and one-half parts, liquid measure, to one of chemically pure sulphuric acid, testing 66 degrees Beaume. Care should be taken to pour the acid into the water, stirring continually. The mixture should test by hydrometer when cold about 1260 specific gravity. This electrolyte should then be carefully poured into the cells until the level is about one-fourth inch over the plate tops.

CARBONIZED CYLINDERS AND BROKEN CRANK SHAFTS.

Many automobile owners and even professional drivers do not apparently realize the importance of keeping the engine cylinders free from carbon, the deposits of which are probably responsible for more broken crank shafts than any other one cause. Knocking due to premature ignition, caused by dirty carbonized cylinders, puts more strain on the mechanism than it is intended to work under.

To clean the cylinders use kerosene occasionally, and run as weak a mixture as possible. A thoro cleaning can only be made by taking down the engine and scraping. A judicious selection of lubricating oil will also help keep the cylnders free from deposits.

HERZ TIMER 1908

with **Ballbearing.** The Standard Circuit-Breaker of Europe and America.
Scientifically accurate timing. Lowest possible current consumption. Toolsteel contacts. Made in 20 different models to fit any make of motor.

BOUGIE MERCEDES 1909

Acknowledged all over the world as the best spark plug ever made. The best for high tension ignition. Proof against oil or soot. The only plug that is absolutely self cleaning. No porcelain. Insulation of double stone.
Guaranteed never to crack. No packings. Guaranteed for one year.

HERZ
AND CO.

B. B. PUMP

The success of the Paris Salon.—A Double Piston Power Pump driven by gear, belt chain, etc. No leather packing but Piston Rings. Nickel-Steel Crank. Used for high speed and continuous use. Special model for garages. Guaranteed pressure 100 lbs.
Used on U.S.S. Connecticut. Highest indorsement.

MOTOR-WHISTLE

Special Petticoat Chime Whistle. An aristocratic signal for car or boat.
WHISTLE TANK with check and safety valve.

OSCILLUM Spark Gap.

All metal and glass. Spark intensifier and spark indicator.

203
LAFAYETTE ST.
NEW YORK

HERZ DISTRIBUTOR

For Dashboard.—Will work for years unattended. Special model for boat work. Double swivel base. Plate glass cover. Connections flexible. Adjustable spring contacts. Toolsteel vs. Toolsteel. No moving parts exposed.
3 cyl. 4 cyl. 6 cyl. 8 cyl.

HERZ-DISTRIBUTOR —Compact 1909.

Our newest European design first exhibited at Paris Salon 1907. Outside dimensions: Width 3¾. Length: 4 in.
Assembled and taken apart in 5 seconds. Quick detachable cable connections. 4 cyl. 6 cyl.

6, capital stock $100,000.00, to exploit a cylinder touring-car design by Mr. Charles Cutting, who had previously had six years erience as a motor car designer. The first tting Six" was on the road in February, 7 but the C. V. I. was first publicly ex- ted at the Chicago 1907 December Show. he C. V. I. Company has a factory in kson and expects to work carefully and d only about 50 cars for 1908, fitted with er 5 or 7 passenger touring car bodies or e or four passenger runabout bodies, price 00.00.

THE MOTOR.

he cylinders are dual units with valves on osite sides. The motor base and the oil bottom are aluminum castings of the

cam-shafts are set ¼ inch outside of the vertic plane of the valve-stems.

The cam-shaft gears are not keyed to t cam-shafts, but are engaged by six-stud ba drivers, having squared eyes on the squar cam-shaft ends.

NOTABLE FEATURES.

This C. V. I. chassis was designed with view to reliability first of all, but with t comfort and convenience of patrons desiri a speedy car constantly in mind. Exce the motor everything is on ball-bearings, Hes Bright for the line and side shafts and F and bearings everywhere else.

THE AXLES AND PRINGS.

The axles are Garford, with bevel balan gears. No ball thrust bearings are fitt except in the clutch-hub groove.

. 1. C. V. I. 1908, 6-cylinder, 5 passenger Touring Car. Wheel-base 117 ins. Gauge 56 ins. Tires, front, 36x3½, re ins. Motor six cylinders, 4x5 ins., 4-cycle, water cooled, 30 H. P. at 1000 R. P. M. Selective sliding gear, 3 forward spee reverse, with bevel gear drive to full-floating, divided rear-axles. Road clearance, 10½ ins. Weight, 2600 lbs. Pri 0.00, including 5 lamps, mats, horn and tools. Cape Top, $150.00 extra.
adster, is also marketed with the same chassis as Fig. 1, save tires, which are all 36x3½ ins., and changes in positions a s due to different body form. Weight, 2550 lbs. Body to carry 3 or 4 passengers. Price, $4,000.00, including 5 lam horn and tools.

l type. The 6-throw crank shaft has the throws together, the middle throws ther and the throws next the ends together. e three groups of two cranks each are set degrees apart. This shaft is mounted n annular F. S. bearing at the front, five n bearings between the cranks and two S. bearings at the flywheel end.

he valve ports are all $1\frac{13}{16}$ inch dia. exhaust es lift $\frac{3}{8}$, intake valves $\frac{5}{16}$ lift. The cams pplied to the $\frac{7}{8}$ cam-shafts which are each annular F. and S. bearings. The cams retained with one Woodruff Key and one r pin in each. Each cam-shaft is in a long an of its own, cast integral with the motor- , and is capped with one long cover, in-

The springs are half-elliptic in front, 42x ins. wide, 7 leaves, tongued, grooved an banded, perched 18 ins. from front-eye t center of axle, jointed to the chassis frame i front and linked in the rear. The rear spring are plain full-elliptics, 38x2 ins., 7 leave fixed to the rear axles and revolubly secured t trunion brackets on top.

STRUTS AND TORSION ARM.

Both are fitted. The struts have fla vertical joints at both ends, with screw length adjustment

The chassis frame has parallel sides, all 3 ins. wide, and is raised 2½ ins. at the rea A subframe is used to support the motor whic is mounted on six lugs. The change spee

mpany to make up its cars into dis-
ctive models to be known by the cal-
dar year, but rather to incorporate im-
ovements, as fast as they are proven
, in the current output of the factory.
ere are, however, a number of inter-
ing and important changes in the 1908
dels known as the Berliet cars. Three
ferent chassis models will be made, one
them being entirely new, with a six-
inder motor. The other two regular
asses will correspond to the 1907
dels in being of forty and twenty-two
rse power, respectively, but each em-
lies several changes.

over the rear of the frame 3 or 4 inch
The chief modifications, however, are
the ignition and lubrication. Jump spa
ignition is used with high tension Bos
magneto. The advantages are a red
tion in the number of working parts,
ing away with all the make and bre
mechanism, thus reducing the noise. T
proper adjustment and synchronizing
the make and break ignition is not
tirely understood by the great major
of chauffeurs, and with a high tensi
magneto this difficulty is eliminated.
sults of tests made with the Bosch hi
tension magneto abroad and here indica

Fig. 1. · 1908 six-cylinder 60 H. P. Berliet. Cylinders, 4¾x5½ inches, cast in pairs, of vana
um iron, selective sliding gear, four speeds ahead and one reverse, direct on both the thir
d fourth. Side chain drive, multiple disc clutch. The frame and axles are said to be o
ported vanadium steel. Wheel base, 126 inches; weight, with complete equipment, 3600 lbs.
ice, $7500, or with limousine body, $8500.

THE NEW SIX-CYLINDER CAR.

'he six-cylinder car will be the leader
1908. It is designed for compactness,
ntness, power, flexibility and ease of
trol. It has the same wheel base as
forty horse power car, 126 inches, and
weight is only 300 pounds more. The
cylinders are 4¾-inch bore by 5½-
h stroke, and the length of the hood
no greater than that of some four-cyl-
er models. This car, as well as the
ty, has a direct drive on both the third
fourth speeds. The ignition is by
h tension magneto; it has a force feed
rication, multiple disc clutch, double
in drive, sliding gear transmission
h selective control, four speeds for-
rd and reverse and four brakes, and it
claimed is capable of making 70 miles
hour.

n specific detail, the six-cylinder
ssis is similar to the 1907 forty horse

that it is quite as reliable as the ma
and break.

LUBRICATION.

For the lubrication of this motor,
reservoir has been provided in the b
tom of the crank case with a capac
of about two gallons. This is kept fill
with oil and is piped to a gear pu
driven from the exhaust cam shaft
spiral gears. This pump delivers oil in
a tube running thru the bottom of t
crank case from end to end, and co
nected in the most direct manner wi
the main line bearings. The oil is the
fore forced into these bearings on t
underside of the shaft, giving a positi
and absolutely reliable force feed lub
cation at all times. Pet cocks are p
vided at the side of the crank case
the purpose of gaging the height of t
oil when filling the case, the same as
the other models. No constant feed

TRUFFAULT-HARTFORD SHOCK ABSORBER

THE DEVICE THAT MADE

Safe, Speedy and Comfortable Automobiling Possibl

The spring action of a car affects its smooth running qualities. Proper control of the springs p vents excessive oscillation, which insures LESS WEAR and TEAR, LONGER LIFE OF TIRE GREATER SPEED and GENUINE COMFORT.

This control of the springs can be secured only by the use of TRUFFAULT-HARTFOR Shock Absorber—the device that has made SAFE, ECONOMICAL AND COMFORTABL automobiling possible.

In the 1908 model we believe that we have practically obtained perfection.

A distinctly new feature has been added, consisting of a regulating dial with indicator, makin possible for even a novice to obtain a perfect and uniform adjustment to suit the exact requirements the car as measured in terms of its gross weight, and easily secure the maximum benefit.

The Truffault-Hartford is the only spring retarding device manufactured with a regulating dial. is automatically lubricated, absolutely dust and water proof, interchangeable, practically indestructible fully guaranteed.

The superiority and individual qualities of the Truffault-Hartford Shock Absorber are best dem strated by the fact that it has been adopted exclusively as equipment by such prominent cars as the :

PIERCE GREAT ARROW, STUDEBAKER, STEVENS-DURYEA BIG SIX, STODDARD-DAYTON SIX CYLINDER, MARMON, CONTINENTAL, LANE, CONOVER, SULTAN, FRONTENAC AND ACME SIX CYLINDER.

lf, which is embodied in the magneto. transmission is of the same type as l on the 40 with direct drive on both third and fourth speeds, but is some- t heavier all the way thru. In other ects this car is identical with the y horse power. The price fully equipt he six-cylinder, with touring or run- ut body, is $7500; with a limousine y, $8500.

an overflow pipe to the tank.

No change has been made in the ca buretor or ignition. The steering gea has been slightly modified. Instead being attached to the frame, it is now a tached to the crank case, and bolted thr the supporting arm of the case and th frame, making a somewhat more substa tial construction, and at the same tim giving more rake to the steering post. Th

Fig. 2. 1908 Berliet six-cylinder 60 H. P. motor. The bore is 4¾ and stroke 5½. Cylin- s in pairs of vanadium iron, which it is claimed wears to a polish, and is better than gray . High tension, jump spark ignition by Bosch magneto. Lubrication force feed direct to the rings, with overflow tank at the bottom.

E FORTY H. P. FOUR-CYLINDER CAR.

ere are several changes in the four- der, 40 H. P. model, notably the fol- ng: The radiator has been moved slightly, the front of it now being tly to the rear of the front axle. The fly wheel has been discarded, and a iron fly wheel substituted, and a belt en fan placed directly back of the tor. The oil tank, instead of being to the left side of the car and cut- in the running board, is carried at eft side of the crank case, just under horizontal web connecting the case the frame, and its filler cap projects ru the case, making it very accessi- or filling. Instead of forcing the oil this tank to a float chamber in the cator, it is now forced into a sight on the dash by means of a small gear driven from the cam shaft by spiral . The oil delivered from this pump rried to two sight feeds in which the

spark and throttle control levers on th wheel remain the same, but their connec tions at the lower end of the steering col umn to the ignition advance and throttl have been changed so as to be entirel above the horizontal web of the cran case where they are entirely protecte from water, mud, etc. The multiple dis clutch remains the same as before, an the same transmission is used, with thir and fourth speeds direct. The contro levers have been changed, so that th brake lever is outside of the gear shiftin lever. The price of this model, with tour ing or runabout body, is $6500. Limousin or landaulet bodies cost $1000 more.

TWENTY-TWO H. P. SHAFT DRIVE CAR.

In this car, the general lines remai the same as heretofore, the location o the motor and radiator being the same The transmission is entirely new, becaus of changing from a side chain to a shaf

ACME

applied to the driving shaft, the ght of the vehicle being carried on the ionary part of the axle. With this ar- gement it is also possible to remove driving shaft without removing the eel. The differential housing is made one piece with a removable cover, so igned that the entire differential and el driving gears may be removed by ply taking off this cover. In fact, all driving mechanism may be taken out, the axle without even jacking up the or removing the wheels. This con- uction also renders the working parts ly accessible for inspection, and also adjusting in the factory. The axle is ssed and of comparatively heavy con- uction. No camber is given to the eels. Radius or strut rods are used necting the axle with the frame sides, propeller shaft or transmission. The co tracting brakes are operated by a peda and the expanding brakes are operated b a hand lever. Air space is provided b tween the drums of these brakes to faci tate radiation of heat. The gasoline tan is placed under the chassis just back the axle, as heretofore. Gasoline forced to the carburetor under pressur as in the previous models. As this ca is built specially for town use, the whe diameters have been slightly reduce tires being 880x120 m.m. rear and 870x9 m.m. front. This car, limousine or lan aulet, sells at $6000.

All the models, it is claimed, are mad of imported materials, vanadium steel an iron truout, and all cars are sold full equipt for use, including tops.

Single Center Buggy Company's Runabout

the accompanying photo is shown a high wheeler, which, in the language he maker, Single Center Buggy Co., of nsville, Ind., is, "Not a buggy but a looking automobile runabout." This has 36-inch front and 38-inch rear els, fitted with solid rubber tires. It a long wheel base, and is more of a engaging a special metal disc at the rea of the flywheel. The frictional engag ment is obtained by means of a foot leve The drive to the rear wheels is by sid chains, the cross shaft carrying twelv tooth sprockets, and 52 tooth sprock wheels being clipt to the rear wheel The foot brakes act on the countershaf The car is steered by a hand wheel thr a worm and segment. The speed is 3 t 25 miles per hour, the changes being o

Single Center Buggy Company's high wheel-ed "Roadster Runabout." The motor is two ders opposed, 4½x4, rated at 12 to 15 H. P. Sarven wheels, 36 and 38 inches in diameter, used, with 1¼ V or round solid tires. A friction change speed is used, consisting of tra- ng friction rimmed wheel on the countershaft engaging by pedal action the rear of the fly- l, which has a special metal face. Plenty of parcel room in the rear, and 17 inches road ance. Timken roller bearings are used in the wheels. Price, $675. Another car on similar but with 32-inch wheels and 3-inch pneumatic tires is offered for $800.

ster than anything heretofore shown large wheels. The motor is a two- nder opposed type, 4½x4, rated at 12- I. P., is 4-cycle, and has automatic in- valves. A Schebler carburetor is . The ignition is by jump spark, ob- tained by means of a hand lever whic serves to move the friction wheel.

The body has panel back seat, and fitted with mud guards. It is finished i purple lake, the running gear is either re or Brewster green; made wide or narro

clutch is enclosed within the fly- and made absolutely dust proof and

squares or round taper with keys. The driving pinion in the rear axle is integral with its spindle, and is mounted between two Hess-Bright bearings. The differential is mounted in the rear axle in special ball bearings on its hub extension, and the connection to the driving axle is made thru the hardened squares.

The rear wheels are clutch driven, and the load is carried on unusually large Hess-Bright bearings, practically within the load center. The axle being of the semi-floating type, the load is carried on the axle housing, the bearing of the driving axle next to the differential acting as a support in resisting lateral strains.

All parts constituting the right and left halves of the rear axle system are interchangeable. The tri-angular torsion rod which has been a feature in Premier construction for five years is retained.

Two sets of brakes are used, both be-

The 3 Best Divided Wind Shields

The Voltz

Its simplicity causes its popularity. No explanation of this clever shield is necessary as the cut is self explanatory. It is the lightest, strongest and simplest shield made. All brass—no top rods or hinges—quickly operated. Furnished to fit any car.

The Schildback

This Wind Shield is not new—over 1000 are now in use. Its construction is such as to entirely do away with hinges. One advantage of which is the top appearance of the Shield, being the same when up or down.

Furnished in full brass or solid mahogany, with brass trimmings, to fit any car.

The Beecher

The most practical and easily worked low priced Shield made.

The small wheel on either side holds the Shield at any angle firmly and securely. Mahogany finish standard—natural ash or painted frames to order, to fit any car.

Send for catalogue.

The Limousine Carriage Mfg. Co.

Digitized by Google

The external contracting brake is camel-hair lined, and operated by side lever. Provision is made for the external adjustment for wear on both internal and external brakes. Both brakes are equalized thru a prest steel brake beam, sliding in two slots in the side frame members. The emergency brake is inter-connected with the clutch.

The usual prest steel frame construction is adhered to and the sub-frame is riveted to the top flange of the main frame, making the forward end of the frame practically box section, and carrying the weight in a straight line section. It is so arranged as to substantially re-inforce the main frame. The lower edge of the sub-frame members is turned inward, and provides a means for fastening a prest steel pan, completely protecting the under side of all mechanism from the radiator support in the front to the cross girt back of the transmission.

1908 Babcock Electrics

The well known line of Babcock electrics made by the Babcock Electric Carriage Co., of Buffalo, N. Y., is offered for 1908 without material change. There are in all five models, known as Model 1 Special, Models 5, 6 and 10, and a Brougham.

CHANGES IN MODELS 5, 6 AND 10.

In Models 5, 6 and 10 there are some features not previously shown. The principal change is in the controller and method of operation. In these models the speed is controlled almost entirely by means of a foot lever. There are five speeds forward and two reverse. After the controller handle has been placed at the desired speed, it is not necessary to again touch it, unless the rate of speed is changed. Once under way the car can be slowed down, allowed to coast, or the countershaft brake applied and the car brought to a stop, all with one movement of the foot lever. There is besides a foot lever, operating brakes that act on the rear wheels. This method of control makes the operation of these models extremely simple, and reduces to a minimum the amount of power lost while changing speed.

BRIEF SPECIFICATIONS.

Model 5 is a roadster, intended for long distance. Its makers claim for it the highest speed and greatest mileage capacity of any electric automobile on the market. The range of speed is from 6 to 26 miles an hour. On the third notch, 16 miles per hour, 85 miles it is claimed can be obtained on a single charge, if properly operated. It weighs about 1600 pounds, has a 78-inch wheel base; 32-inch wheels equipt with 3½-inch pneumatic tires. The power is obtained from a 36-cell battery, made by the Babcock Company, distributed half in front under the hood and half in the rear of the body, and the motor is suspended from the chassis under the seat. It has a double chain drive of the latest improved type. The price of this car is $1500.

The Victoria phaeton, Model 6, is a strikingly handsome vehicle, and is particularly adapted for use by women. It is hung low and has continuous mud guards, which make it impossible for the garments of the occupants to get soiled. It is very roomy, but very light in appearance; is capable of high speed and great mileage. It weighs about 1700 pounds, the wheel base, wheels and motor being the same as on Model 5. It is equipt with specially constructed 3½-inch double tube tires. The battery is the same as on Model 5. The upholstering is of the finest quality of broadcloth, and the price is $1700.

A light weight vehicle of coupe type is known as Model 10. It has a very roomy seat, and all the windows can be dropped, thereby making a comfortable vehicle for warm weather. A special arrangement of the steering wheel makes it possible for the operator to enter from either side. It is claimed by the builders that because of its light weight it has greater mileage and speed than any other coupe. The chassis is the same as that of Model 6, and the body is so arranged that it can be removed, and the Model 6 Victoria body put on in its place. It sells for $2100.

The Stanhope Model 1 Special is intended for very large people. This car hangs low, and also has continuous mud guards. It has a wheel steer with tilting mast, making ingress and egress extremely easy. It has a 66-inch wheel base, wheels being 32 inches front, 36 inches rear. Solid tires will be furnished if desired. The power is derived from a 40-cell battery, made by the Babcock Company, giving a radius of 50 miles—65 miles on level roads. This car is capable of climbing a 28 per cent. grade, and sells for $1800.

The Brougham, which is a splendid type of the luxurious town car, is upholstered in French goatskin, and has on the inside all the appurtenances that one using such a vehicle could need for calling and theatres. Five persons can ride inside and two outside, beside the operator. The controller is of special design, and is operated by a handle on the steering mast, under the steering wheel. There are four speeds forward and two reverse. Powerful internal brakes act on the rear hubs, and there is, besides, an electric brake. The operation is similar to that of the clutch lever on a gasoline car. The wheels are of special construction, fitted with standard pneumatic tires, 3½-inch on front, and 4-inch on the rear. The price of this car is $4000.

is a most unique mechanism with idea in mind of having this vehicle ated by coachmen and unskilled dri- Monsieur Chedru made it trouble- by eliminating most of the ordinary es of trouble, and condensing the r plant into two castings. The first ese is of special high grade grey iron, contains the four cylinders cast inte- with very large water jackets, the ntake manifold, the exhaust manifold,

Fig. 3. Forward end of new 4-20 Thomas town car, showing the right side of the two-piece tor, the heavy steering linkage, the control levers on the side and the foot accelerator. A throt- lever is also on the wheel, but there is no spark lever. The clutch is of the three disc type, the change speed gears are in a manganese bronze housing integral with that of the floating r axles. Compactness, simplicity and foolproofness, combined with light weight, are the feat- s.

water outlet manifold, the latter being red with a brass cap. The forward of the two gas manifolds are covered a plate. These constitute the only ings in the casting, and, therefore, only chance of leakage. Danger of is reduced to a minimum by having e carefully fitted and held by large s. The other casting is of manganese ze and contains the engine base, k case, water intake manifold, water

single cam shaft on the left side of the machine. An additional gear drives the Bosch high tension magneto, which, following the French practice, is the only means of ignition.

COOLING.

The cooling is by the thermo-syphon system. This is rendered very effective by the large water jackets of the cylinders and large manifolds. The radiator is of the honey-comb type. In place of the usual fan back of the radiator, blades on the periphery of the flywheel take care of the air circulation. The exhaust manifold is cooled by air-cooling flanges which run its entire length, while the ingoing gas is partially heated by the exhaust. The valves are water jacketed, and even after several hours running it is claimed it is possible to hold the fingers upon the exhaust valves without ill effect.

CLUTCH, CHANGE SPEED AND BRAKES.

The clutch is of the well known 3-disc type, and is placed in the flywheel. Back of this is a single universal joint connecting with the main drive shaft which runs thru the oil tight casing direct to the change speed gear set on the rear axle. This casing is filled with oil for the lubrication of the shaft, and also acts as a torsion rod for the axles.

The rear axle is of floating, ball bear

"WHITNEY" CHAINS

January 1, 1907 to November 1, 1907, conditions as follows

On January 1, 1907 we were renting about 38,000 sq. ft. of floor space in a building not adapted for our growing business. At the same time we were giving much attention to our new buildings which were under construction and not complete until July 1907. During this period we moved our entire equipment to our new factory and for a number of weeks were obliged to operate machinery in both plants. We also carried on important experiments and constructed much special apparatus for our new factory. While thus handicapped we could not fully meet the increasing demand for "Whitney" Chains. Nevertheless, we succeeded in shipping a greater number than ever before for an equal period of time.

"WHITNEY" CHAINS

November 1, 1907, to December 31, 1908, conditions as follows

New fire-proof factory, one of the best, strongest and safest in the country. Floor space over 70,000 sq. ft. Best of light and excellent condition for employes. Location one of the best in Hartford. Private side-track connecting with main line between New York and Boston. Land area over ten acres. Large increase in new machinery and tools. Improved methods. Inspection system more rigid than ever. Greater accuracy. Increased strength by the use of new materials and improved treatment. Greater durability. Better finish.

THE WHITNEY MFG. CO.

ed with air flanges, such as are found air-cooled engines. Even in mountnous countries it is claimed no diffity will be experienced by the overting of the brakes.

'his chassis is used both as a public vice cab, for which it is equipt with a y of rather plain finish, and also as a n car, some of the bodies for the latbeing very rich and elaborate. These lude brougham, limousine, cabriolet landaulet designs. As a cabriolet it ts four passengers, and as a brougham, ousine, landaulet or doctor's car five. e prices of these are $3000, respectively, h the exception of the limousine, ich is $3250.

1908 "Jewel 40" Touring Car

'he Forrest City Motor Car Company, Massillon, O., well known as the mak of the Jewel two-cycle runabout, are ering for the season of 1908 in addition the little runabout a new 4-cylinder ring car, built along conventional lines known as the "Jewel 40." This new del is provided with a 1908 Rutenber tor, and not a two-cycle engine as ght be expected. The bore is 4¾ and oke 5 inches, and the rating is 40 H.

The New "Jewel 40" Touring Car, 1908 Rutenber motor, 4¾x5 inches, 40 H. P. at 100 P. M. Double ignition system, Bosch high tension magneto and storage battery and singl il with distributor. Selective sliding gear with Timken roller bearings, three speeds forwar d one reverse. Floating rear axle on Timken bearings and an I-beam section front axle dro rged in one piece without weld. Two sets of brakes on separate drums separated by air spac r cooling. Wheel base 117 inches, 36-inch wheels, 4-inch quick detachable tires, seats seven ice, fully equipt as enumerated in text, $3000.

at 1000 R. P. M. Speeding up to 1500 P. M. is said to be practicable, a conuent increase of power being obtained. e cylinders are cast separately with inral jackets. The valves are on one

bowl contains the float, valve, and fastenings.

The clutch is a cone faced with sp cial prepared leather, and provided wi a series of springs to ensure gradual e gagement.

IGNITION.

In the installation of the ignition syste the maker states that economy and abs lute reliability for the owner have be the two objects in view. Two sets spark plugs are used, one set being ope ated in connection with an import Bosch high tension magneto, and the oth set with storage battery and coil. Bo systems are separate and independe Should either of them become unavailab the other can readily be put into use turning a conveniently located switch.

The change speed gear is of the proved three speed sliding type operat on the selective principle by a single si lever. This method allows of a chan from any speed to another without pa ing thru any gears. The aluminum ca is said to be oil tight. The shafts a mounted on Timken roller bearings.

A large muffler is mounted on the l side in a fore and aft direction, and sists materially in making the car ve quiet running at all speeds.

The cardan shaft is provided with t ball bearing joints, thus providing fle bility and insuring good wearing qua ties.

Did you ever notice that the average man begins to apologize when he takes out a dollar watch, says his real watch is at the repair man's?

The same is true of a man with a cheap speedometer on his car, says he is going to get a new one this spring, or that his car is a cheap one and he does not care on this car.

No one has to apologize with a Warner Auto-Meter on his car.

QUALITY LAMPS

Skill in the building, care in selection of material, and practicability as well as beauty in designs have made the Atwood Lamps and Generators the foremost product of their kind in the world. Constant improvements, the most severe tests upon completion, and careful and minute inspection through every process of construction have conserved the reputation for quality so consistently earned during 35 years in the building of lamps.

"Barndt-Johnston" Roadster Body

e Barndt-Johnston Auto Supply Co., Donaldson street, Columbus, O., is of- g the trade a new roadster body n can be converted into several dif- t kinds of combinations.

r instance, with the back end and seat taken off and a turtle back put he result is a runabout body for two engers only. The turtle back can be ved, and the rear part of the body ack on with 4 bolts, and a mechanic's put on, or the mechanic's seat can be n off and a 2-passenger seat put on, ng a surrey body. The dash and are made of aluminum coated steel. rest of the body is constructed of the best of white ash and poplar panels; ct, the entire body is constructed of metal and wood, utilizing the differ- materials wherever the best results be obtained. This body is furnished lete, including the dash and with kind of seats that the customer may e.

"Le Janus" Horn

new horn known as "Le Janus" has tly been introduced by the Motor Equipment Co., of 55 Warren street, York City.

"Le Janus" Horn.

e horn, as its name implies, is two- rubber bulb and musically tuned reed An adjustable swivel bracket is fitted which allows the horn to be placed on any part of the machine. The horn takes up only 9 square inches of space, and pre sents a neat and attractive appearance.

The "Rough-Rider" Cushion Ventilating Button

The Ventilated Cushion and Spring Co. Jackson, Mich., maker of the well-known Rough-Rider cushion springs, described in our May, 1907, issue, page 141, also make ventilating buttons to be used in conjunction with the Rough Rider springs. In order to allow full play of the springs it is necessary to avoid air compression on the one hand, or any vacuum on the other. The accompanying cut clearly illustrates the construction of this device. It will be observed that the shank of the button is made so that it makes a hollow connection with the interior of the cushion, every button acting as a ventilator. Besides adding to the resiliency of the

Cross Section of the "Rough-Rider" Side Ventilated Button, showing air circulation.

cushion it is claimed for these buttons that they prolong the life of the cushion, the ventilation keeping the interior perfectly dry and free from must or mould, and leaving no chance for the leather, hair and cloth to rot out. Two styles of these buttons are made, one style allowing the air to escape from the periphery of the button, and the other from the top of the button.

The manufacturers sell these buttons only in connection with Rough Rider springs. They have a department in their factory devoted to making new cushions in any size or making over old ones.

The Pittsburg Automatic Vise & To

niversal Rim, that have not heretofore een described in these columns. This

Safety Universal Rim Arranged for Clincher ire.

m is the product of Firestone Tire & ubber Co., of Akron, Ohio, and as shown two of the drawings is suitable for ther detachable tires of the Dunlop type clincher tires. The base rim (A) is

Safety Universal Rim Arranged for Quick De-chable Tire.

tached to the felloe of the wheel, and B) and (C) are removable, quickly de-chable flange rings with rounding tops prevent rim cutting. A split locking ng (D) holds the outer flange ring (C)

The only tool needed to manipulate the Safety niversal Rim.

place on the base rim (A). Another rawing shows this rim with different ange rings, so shaped as to receive incher tire beads. Either or both sets removable flange rings may be had with e base ring and retaining ring as desired, slight charge being made for the extra t of flange rings.

Locking Device of the Safety Universal Rim.

The locking device of the Safety Uni-ersal Rim is very simple but effective. n the outer flange ring are two pins hich slide into corresponding holes bored

this rim and this consists of a handl which is pivoted a small lever on the end of which is a small pin correspon in size to holes in the ring (D) that placed to the right and left of the h which engage with the pins in the fla ring (C). On the corresponding end the handle portion of this tool is a sim pin. To manipulate the split ring these pins on the tool are inserted in th additional holes and the two ends of split ring drawn together.

New Hartford Quick Detachable Clincher Tire

The Hartford Rubber Works Co., Hartford, Conn., have added to their for 1908 a new quick detachable clinc tire which we show herewith, on Midgley Universal Rim. This tire ha non-extensible wide edge somewhat sim to their Dunlop tire, but with a heel its side which fits into the clinch of rim. There is no toe to the clinch of

New Hartford Quick Detachable Clincher

tire. The tube lies inside the tire in actly the same form as in the Dunlop t of tire. This new Hartford quick det able clincher will fit any form of det able rim on the market. It is furnis with either smooth or Midgley tread, Midgley tread being of flat form and sisting of a series of spiral springs wo in the rubber to give good traction on road surface.

The New York Coach Lace Co., 296 157th street, New York City, manufactu and imports laces for automobile trimmi in both silk and worsted goods, silk

added to its line some new styles of holders illustrations of which are wn herewith.

e "Allen" Tire Holders for top of limousine back of car.

he Allen tire holder for limousines is le to fit on the top of the body, or it also be attached to the back as shown he accompanying cut. It is made of

The "Allen" Tire Lock No. 1.

nze and is adjustable to hold from one ch to two 5-inch tires. Two styles of eners are furnished as indicated by . 1 and 2 in the cut. The list price per of any three pieces is $10.00. Single es list at $3.50.

The "Allen" Tire Lock No. 2.

of having a Yale Chest Lock, fitted in the casting, a high grade Yale Padlock furnished, which is used in the manne shown in the accompanying cut. Pa ticular attention is called to the lock co struction which is shown in detail. Th tire lock has a capacity of two 5-inc tires and lists at $7.50.

1908 Additions to the "Gilbert" Line

Gilbert Manufacturing Co., New Have Conn., has made several additions to i line of fabric specialties for the comin season. It includes in its 1908 line tw new tire cases, one a wire edge case, ar the other a buttoned case. The wire edg case fits smoothly and snugly around th tire, and is quickly put on or taken o

New Gilbert Buttoned Tire Case.

The price fiinished in black enamel duc is $4 for any size, and in black fabr leather $5. In colors the price is cents extra. The buttoned case is also snug fitter, and lists at $5 in black enam duck or $6 in black fabric leather, cents extra being charged for colors. Bo of these styles are guaranteed wate proof by the maker.

Gilbert Box Cover.

Another addition to the Gilbert line a water-proof cover for tool and batte boxes, and the Gilbert company is also fu nishing water-proof baggage covers in tw sizes for enclosing one or two suit-case The battery and tool box covers are fu nished for all sizes and styles of box used on standard makes of cars. Digitized by Google

The Atwood side oil lamp for small touring cars or runabouts is constructed on the tubular or cold blast principle, and is made of full brass silver lined. One size only is offered. It is 12 inches high (without handle), 6¾ inches long, and has a 6⅞-inch flange. It lists at $10.50.

Style No. 90 is fitted to burn electricity. It is made in full brass, silver lined and highly polished. The size of the glass is 4¾x4¾ inches. This style lists at $20.00 per pair.

The Atwood No. 44 generator is made of heavy seamless drawn brass. It is fitted with a carbide basket of 4 pounds capacity, and will supply from 1½ to 2 feet of gas per hour according to size of gas tip. The generator is divided into three principal parts: Top part, lower part and carbide basket. The top part constitutes the water tank which holds the water that drips upon the carbide. The lower part is a receptacle for holding the residue or ashes, and No. 44 is surrounded by a water jacket. The carbide is likewise contained in the lower part of the generator. One of the features of this generator is an improved quick cam adjustment, which has a nut on same to take up any wear. This generator lists at $15.00 with water jacket, and at $13.00 without water jacket.

Kalamazoo Carburetor Model B

Kalamazoo Carburetor Co., 1301 Grand avenue, Kalamazoo, Mich., is now ready with a new model of the Kalamazoo carburetor which is cataloged as Model B

This carburetor is supplied with either vertical or horizontal outlet. It has a butterfly valve at each end of the main air passage, one serving to throttle the engine and the other to reduce the proportion of air and produce a richer mixture for starting with a cold engine. The float in the new model is concentric with the gasoline jet. A brass tube, inserted in the float is guided on the central stem and the gasoline valve is operated by a pin thru the tube and valve stem, the central post being slotted to allow vertical movement of the pin.

A novel feature of this model is the manner in which the gasoline is drawn from the float chamber into the main air passage. This is done by applying the principle of the airlift, as successfully used by hydraulicians in pumping deep wells.

ward, outside the adjusting screw, the main air passage. The proper mi is obtained by regulating the depth o screw in the enclosing well, one pos of the screw giving the proper mi for all throttle positions.

For this arrangement several advant are claimed. The float is adjusted so the point of the adjusting screw b touches the gasoline or is slightly mersed in it, with no danger of lea This makes the carburetor very sens at low speeds and when cranking.

Sectional view Kalamazoo Carburetor, Mod

equivalent to maintaining the gas level precisely at the top of the jet i ordinary form of carburetor. Anothe vantage is that the gasoline may rise siderably above its ordinary level wi leaking or accumulating in the air pas thus putting increasing pressure upo float valve. This also prevents dri of gasoline on stopping the motor when driving rough roads.

This model B is very compact and be readily attached to almost any n without change. Several throttle posi and movements are offered to adapt various steering post levers. This will also continue the manufacture of multiple-jet carburetor, which wil furnished in the 1908 model both horizontal and vertical outlet.

"Crown" Soap and Metal Polis

The Crown Soap Co., Syracuse, N makes a specialty of soft oil soap after a secret formula. A special fe of "Crown" soap is its quality of prese the finish of a car body and the m states that it can be used on the highly polished surfaces without fe results. It is a vegetable soap conta no free alkali.

TIMES BUILDING .·. NEW YORK

Hosted by Google

t is now sold to the United States e thru a branch located at 116 Broad et, New York City, established recently the manufacturers, S. Smith & Sons, , London, England. This indicator rates by centrifugal force and springs ch actuate the indicator hand. The ernor is mounted horizontally and en by a flexible cable thru gearing. gearing is used to allow a slow turn- of the flexible shaft, and the shaft tes at a very low speed. The drive the wheel is by friction, a rubber being prest against a disc to give tive drive. This construction is very ble and adjustment is easily made for rent sizes of wheels. Three springs used to govern the movement of the cator, a weak spring for low speed, a

1908 Smith Speed Indicator.

um spring for higher speed, and a g spring for top speed. These springs into use successively as the speed e car varies and the variation of the er is practicaly uniform. The pointer ost sensitive on the low speed and a hair spring is used to keep it steady revent back lash. The unique feature is instrument is the marking of the on each indicator by hand according e results shown at known speeds in factory. In each instrument, there- compensation is made for the est variation in the strength of the gs, and absolute accuracy thus at- d. The scale on the dial is almost a lete circle being 8½ inches long, and dicator is therefore easily read from art of the car. The case of this in- ent is of solid brass of water-proof ruction, and highly ornamental. This

size set screws, nuts and bolts.

The handle and heads are made of high grade drop forgings, and the wrench is as strong as a solid S or straight wrench. It uses the various heads on one handle and it takes the place of several wrenches

The "Ferret" Wrench.

such as S and off set wrenches. It can be used as a ratchet thru about 90 degrees working equally well in both directions without any change. There being no springs or pawls, the wrench is indestructible and the use of solid heads prevents the turning off of corners when used on nice work.

These wrenches will be made in special sizes and shapes when ordered in sufficient quantities.

Gray & Davis Lamp Piping System

Gray & Davis, the well known lamp makers of Amesbury, Mass., make a practice of fully investigating every lamp complaint that comes to their notice, and they advise us that they have found that fully half of the troubles with gas lamps have been traced to defective piping. They have, therefore, prepared a diagram of a correct system of piping for gas lamps which they believe all users of gas lamps

Diagram Piping System for Gas Lamps recommended by Gray and Davis.

would find profitable to use. In this system, which is illustrated by the drawing herewith, all pipe pitch downward to the drip cock, and each lamp is piped independently, all the piping coming together at a trap. Gas from the generator or gas tanks enters the trap below the piping to the lamps. The drip cock should be

the potential between consecutive step being reduced to a point below that a which arcing could occur.

They are also furnishing complete bat tery charging panels for private plants mounting rheostats above described, o the back of the switchboard. On the fac is mounted a line switch, fuses, overloa and underload circuit-breakers and rheo stat controlling handle. With this pri vate plant switchboard a charge can b started at any desired rate, and then left for when the cells are fully charged th circuit will be automatically opened. A a result, it is possible for an owner t start a charge at night, and when the cell are fully charged the circuit is opened au tomatically.

Lumen Bearing Metals

The Lumen Bearing Co., of Buffalo, N Y., is manufacturing an extensive line o bearing alloys, suitable fo. all conditions and in various degrees of strength, elasticity, etc. One of its main products is a composition known as Lumen, which combines in a marked degree the excellent wearing qualities of genuine babbitt with the strength and rigidity of phosphor bronze. It is claimed to be from 20 to 25 per cent. lighter in weight than ordinary bronze, and is also considerably lower in price. It is non-magnetic, and a metallurgical test of it shows the following: Weight, 4 ounces to the cubic inch; specific gravity, 6.93; tensile strength, 33,000 pounds per square inch; torsional strength, 35,000 pounds; compressive strength, 80,000 pounds; fusing point, 725° F.; shrinkage in sand moulds, 7-64 inch to the foot; coefficient of expansion in the solid state, .000015 of an inch per degree Fahrenheit. This metal is especially desirable for thrust collars and for bearings designed to carry unusually heavy loads.

For withstanding repeated shocks, and to meet the requirements where only a metal of high residue, plasticity and anti-friction qualities can be used, the manufacturers offer their Electric Bronze, which is a phosphor-bronze composition which is perfectly deoxidized by a special process. This metal machines readily; has a fine texture and is designed for bearings on gas engines, automobiles locomotive main rods, and wherever it is necessary to withstand high speed and severe pounding. The manufacturers furnish finished castings made of this metal, and also sell it in ingot form.

re of which is the fact that it can be sed immediately, and thus two State e numbers can be carried, either of can be brought into use in a few ds. This is accomplished without nechanical contrivance whatever, and mplicity is perhaps one of the most ctive features of the Asbury hanger. hanger is of brass, and at each end tached stout brass rods which form

he Asbury Reversible License Hanger.

by which the hanger is suspended the holder, the latter being permanfixt to the car by means of bolts. To se the hanger it is only necessary to it up full length, and turn it over, so the other ends of the brass rods are ht into use as hooks. The weight of anger, of course, naturally keeps it ing with the right side out, and there possibility of its being reversed unthe user lifts it up full length and it over. At the same time the reng process is so simple that it res only a second to perform it. If the t travels thru more than two States an easily substitute another hanger two more license tags, and be prefor passing thru two more States ut further trouble. The substitution new hanger is the work of but a few es, the attaching device being spedesigned with this in view.

"New Britain" Portable Vise Stand

e New Britain Machinery Co., New in, Conn., realizing the necessity for table work bench or vise stand, has ntly brought out the New Britain ble Vise Stand which will be found ially useful in automobile garages.

e body of the stand is of circular rigidity being attained by means circular column of rolled boiler plate, held between the base and the top. e top, of cast iron, is so shaped that or work may be laid upon it, and in ng from place to place they will not

vise side is far enough back from the working line so that in standing at the vise nothing is in the way of the workman's feet. Provision is made for transporting the bench from place to place by simply raising the self-locking handle to the position shown in the cut, to bring the stand off the floor and to bear upon its three wheels, two of which are dead and one on a swivel. The stand can then be

The "New Britain" Portable Vise Stand.

easily pushed over rough or smooth floors, the swivel behind, and when the desired point is reached, a depression of the lever drops it upon its base, and it is ready for use. Should occasion require, the stand may be worked up into a corner.

The stand is built in two sizes, one in which the top tray is 20x26 inches, carrying a 3½-inch vise, and another in which the top tray is 24x32, carrying a 5-inch vise. In each case, the vise is just the right height for filing, 41 inches. The manufacturers furnish these stands equipt with a standard make of vise, but any make will be fitted where desired. The stand can also be furnished without vise, where the same is to be used as an inspector's cabinet.

F. Matt & Company, 290 Halsey street, Newark, N. J., are manufacturing auto

The New Woodworth Tread is a continous three-ply chrome leather band around the tire, studded with closely set steel burrs. On each side of this band is a self-adjusting steel wire secured by strong buckles and straps to hold it firmly in position and to make the Tread conform to the tire. New hat-shaped steel rivets with broad shoulders and strong heads and a new steel buckle and strap are other improved features of the Woodworth Tread for 1908.

Special Tread

SPECIAL—A Special Tread with oval-headed steel rivets set along the sides for rocky and rutty roads are also important improvements in the 1908 Woodworth Tread.

A set of Woodworth Treads makes the car instantly co trollable, protects it against injury, prolongs its life and mak the tire last three to six times longer. Sizes from 26x2½ 36x 5. Prices $8.00 to $25.00 each.

Prices for Special Woodworth Treads 20 per cent. high than the above.

WOODWORTH BOOT

made of three-ply chrome leather with outside strip reenforced with steel burrs. Protects the cut and worn parts of the tire. Can be adjusted in three minutes. Fastened by heavy strap lacing through strong rings. Take up but little room. A good thing to have with you on a trip.

Woodworth Boot

Kant-Skid

FOR PNEUMATIC OR SOLID TIRES

Woodworth Steel Tire Shoe

Made of steel plates over chrome leather. They are flat on the wearing surface with closely set steel burrs to prevent skidding. Fastened to the tire by hooks on each side. They protect the tire against puncture, skidding and blowouts. You can use up the old tires with safety with Woodworth Steel Tire Shoes.

Steel Tire Shoe

"Kant-Skid" consists of strips of chrome leather across the tire about four i ches apart. Each cross strip has a steel plate and steel studs on its outer surface to take the wear of the road. Safe, Soft, Noiseless, cannot possibly injure the tire. Will outwear any o her anti-skid device. Barred by no road laws, Local, State or National. Every pair guaranteed. Sizes 26x2½ or 3 to 36x4½ or 5 Prices $9 to $13 per pair.

"Lennox" Tire Gas Tanks

e "Lennox" Chemical Company, 1201-
East Fifty-fifth street, Cleveland, O.,
anufacturing a line of tire gas tanks,
styles of which are shown herewith.
e valve used on these tanks can be
ed and closed with a small hand
ch, included with the outfit. The
s are tested to over three times their
ing pressure before being shipt from
actory, and are fitted with safety de-
which permit the gas to escape in
they are subjected to extraordinary
itions of heat.
e prices, specifications, etc., of the
ent outfits made by the Lennox peo-
re as follows: No. 1 outfit is for car
hose, is $15.00.

No. 2 outfit, also for car use, is 25 in
ches long by 4 inches in diameter, and
weighs 28 pounds full and 21 pounds
empty. It will fill 25 to 45 tires. The
price is $18.00, including 10 feet of hose
Clamps for attaching these tanks to the
footboard or other parts of the car in
brass finish are furnished for $1.50 per
pair. A gage for registering the tire
pressure is furnished at $5.00.

An important feature of these tanks is
their flat bases, which permits them to
stand alone top end up.

No. 3 outfit for garage use stands 4 feet
high, and includes a regulator, gage, 10
feet of hose and a truck. This tank will
fill from 75 to 150 tires. It lists at $40.00.

Outfit No. 4 stands 4 feet high, and in
cludes a regulator, gage, 10 feet of hose
and a truck. This type will fill about 200
to 300 tires. The list price is $50.00
Prices for refilling these tanks are as fol
lows: No. 1, $1.75; No. 2, $2.00; No. 3
$2.50, and No. 4, $5.00.

Wm. Harland & Son, 168 Center street
New York, is a concern which has been
established in the manufacture of var
nishes for the coach, carriage and railway
trade for 120 years. Since the advent of
the automobile, they have made a special
study of the requirements of this trade
and are supplying varnishes specially
adapted to automobile finishing. They
claim for their varnishes durability, bril
liancy and perfect flowing qualities. These
varnishes are quick driers and are easily
worked. For this reason they are finding
great favor in the automobile trade. This
concern is furnishing body finishing, gear
and rubbing varnishes.

"Petre" Automatic Carburetor

In designing the Petre automatic carburetor the particular object kept in view was to produce an instrument which will deliver a uniform mixture at all times, regardless of the variations in the speed or load. This has been accomplished by the maker, the Petre Carburetor Co., St. Clair and Ontario streets, Cleveland, O., by taking advantage of the natural law governing the flow of fluids—i.e., under a given pressure (or suction) the flow will be in direct proportion to the area of the port.

The operation and construction of this carburetor will be seen by referring to the accompanying cut in which A is the air valve, which completely closes the air port when not in operation, and J is the gasoline valve (or needle) which completely closes the gasoline port at the same time. The action of the air valve is resisted by a long spring B, which is comprest to such an extent that the increased tension due to the slight lift of the air valve is practically negligible. The air valve will not open until a sufficient suction is produced in the mixing chamber to overcome the tension of the spring, plus the weight of the air valve.

The suction, the manufacturers state, can never increase perceptibly beyond this amount, as no engine when fitted with the proper sized carburetor can maintain a greater suction than with the air valve wide open. Thus it is seen that the suction is fixt by the tension on the air valve spring regardless of any other condition. No matter how fast or how slow the engine may run or what load it may have the suction in the mixing chamber cannot vary, and the flow of gasoline or air will be in proportion to the areas of the ports.

The gasoline valve is lifted from its seat by the action of the air valve thru the lever G and the lifter K. It will be noticed that the fulcrum R of the lever G, the point at which the lever G rests upon the air valve A, and the point T, at which the lifter K rests on the lever G, are in a straight line, giving a lift to the gasoline valve J exactly in proportion to the lift of the air valve.

The tapered portion of the gasoline valve J is of such shape as to make the opening between it and the port S always in the same proportion to the area of the air valve corresponding to a proportionate lift. To change the proportion between the areas of the gasoline and air ports a regulating cap H is provided, by means of which the position of the point T, at which the lifter K rests upon the lever G may be varied at will, thus varying the lift of the gasoline valve. The air valve is provided with a glycering dash pot E, which makes the operation noiseless. The float is direct acting.

When the engine is started the throttle is of course slightly open, allowing the engine to create a suction in the mixing chamber; as soon as the suction has reached the required degree the air valve will open slightly, causing a proportionate opening of the gasoline valve.

By opening the throttle more the suction in the mixing chamber is momentarily increased, causing the air valve to lift until the opening is sufficient for the demand of the engine, when the suction will become normal, and the air valve will stop. Should a heavy load be suddenly thrown upon the engine its speed would be reduced, and consequently the suction would be reduced, and the air valve and gasoline valve would partially close, until the normal suction would be reached when

Section of the "Petre" Automobile Carburetor. A, air valve; B, air valve spring; C, brass tube; D, dash pot piston; E, dash pot; F, throttle; G, lever; H, regulating cap; I, regulating cap clamp; J, gasoline valve; K, gasoline valve lifter; L, adjusting pin; M, hardened steel washer; N, gasoline valve seat; O, gasoline connection; P, float valve seat; Q, float valve; R, fulcrum; S, port; T, resting point of lifter K. As will be seen from the cut the float chamber is situated in back of the gas outlet pipe. The gasoline inlet valve is also sectioned to show its interior construction.

they would stop. The suction then remains normal, and the proportion between the areas of the ports cannot change owing to the construction.

The only variation is then in the quantity which is according to the demand. When the throttle is opened the suction in the mixing chamber will tend to increase if the engine speed increases, but if the engine is so loaded that its speed cannot increase, then no harm has been done by opening the throttle, as neither of the ports has been altered by the operation of the throttle. Four sizes of this carburetor are offered, viz.: 2-inch, 1¾-inch, 1½-inch and 1¼-inch, listing at $75, $60, $50 and $45.

lamp brackets, adjustable tire holders in two different styles, tire pumps, and horn screws.

The "Atlas" adjustable tire holders are furnished in sets of three. These sets are adaptable to any make or shape of car. They are also easily removable for cleaning. They hold two or three tires, and list at $7.50 per set, complete with straps.

"Edco" Spark Plugs, Tire Valves and Tire Lugs

Ch. Dien, 43 West Thirty-fourth street, New York City, is marketing several automobile specialties manufactured in Switzerland. One of these is the "Edco" spark plug here shown. In this plug steatite insulation is used. The insulation does not touch the metal parts of the plug at the inner end, room being allowed

The "Edco" Spark Plug, exterior and sectional views.

for expansion under heat and to prevent breakage from shocks. The insulator is machined to fit into the cone-shaped bore of the bushing, and this provides a perfectly tight fit. The central electrode is made of pure nickel, and carries a conical-shaped flange near its inner end, by which the insulation is held, and a tight joint provided at this point. At its outer end the electrode is fitted with a helical spring, so that the insulation is not held

valve self-locking. The closing o

The "Watts-Detroit" Carburetor

Another new carburetor recently placed on the market is the Watt's-Detroit" carburetor manufactured by the Watt's-Detroit Carburetor Co., 58 Griswold street, Detroit, Mich. In designing this carburetor special care has been taken to overcome the trouble incidental to the varying of the fuel level, due to jar and bouncing over rough roads, etc. This carburetor was designed by Mr. F. J. Watt, vice-president of the R. E. Hardy

Fig. 1. Verticle sectional view of the "Watt's-Detroit" Carburetor. A A, cast brass shell; B B, central air passage; C C C C, reservoir and float chamber; D D, annular hollow float, surrounding central air passage; E E, tube carrying brackets F F; F F, brackets integral with E E adapted to support middle of equalizing levers G G; G G, equalizing levers pivoted at middle and attached at their ends to float D and disc H H; H H, counterbalance weight and steadying disc; I, inlet valve; J, spiral spring; K, fuel passage from reservoir to jet nozzle; L, jet nozzle; M, regulating valve; N, adjusting screw; Q, cover above fuel reservoir, upper surface formed with diagonal passages leading towards periphery of mixing chamber; R, mixing chamber; S, automatic air valve; T, spiral spring normally holding air valve closed; U, cover over air passage; V, auxiliary air passage extending completely around shell; W W, cap, closing top of mixing chamber, and guiding valve S; X, outlet pipe; Y, spring, resisting lifting effect of liquid in reservoir. The dotted line indicates the normal fuel level.

Co., of New York, for whom he designed the original "Sta-Rite" spark plug. It is of the float feed type, with the gasoline jet nozzle and the air intake located centrally.

Referring to the sectional cut, H H is a flat disc, which exactly counterbalances the float D D, and acts also as a dashpot to prevent chattering of the supply valve. This construction makes it impossible for any manner of outside movement to affect the position of the float, which is kept partly submerged by a pair of light springs.

The initial air supply is drawn thru the annular passage B B, and additional supply is drawn thru the large annular passage V, and admitted in varying quantities to meet certain requirements, under the circular edge of the large auxiliary valve S, which opens, more or less, according to speed of motor or position of throttle.

Fig. 2. Horizontal plan view of the "Watt's-Detroit" carburetor, taken on the line X — X of Fig. 1.

The mixture is produced in a distinctly novel manner by rapid rotation of the contents of the mixing chamber, this movement being produced by a peculiar arrangement of fixt guides which confine the air within gradually narrowing channels, so that its speed is easily accelerated to the rate naturally due to the amount of suction, which can be remarkably light in consequence of the freedom of its passage, and the peculiar rotating effect. A suction of only one pound per square inch normally produces a flow at the rate of 332 feet per second, which is fast enough to rotate the contents of the mixing chamber some 500 revolutions per second.

This rotation creates a powerful centrifugal force which carries all particles of liquid to the outer edge of circles where they come in contact with the hurrying air jets, and are instantly vaporized.

Means are provided for regulating the fuel jet, which is made to assume the form of a thin film, shaped like an inverted cone, which crosses the path of both the initial and auxiliary air supplies. The outlet is furnished in any required style, and with throttle valve when needed.

The George N. Pierce Co., of Buffalo, has removed the treasurer's department from 752 Main street to the new offices in the administration building of the Pierce factory. The company will maintain the retail store at 752-754 Main street.

Falls, Mass., U. S. A., well known as the rst American motor-car builders to offer six-cylinder pleasure car for sale, in anuary 1905, and as having been since hat time strong advocates of the superority of the six-cylinder motor for highlass touring cars and limousines, offered -cylinder cars only for 1907.

For the season of 1908, however, the tevens-Duryea Company adds to its 1906 nd 1907 line of two 6-cylinder cars, known s the "Big-Six," cylinders 4¾x5¼ inches, 0 H. P., and the "Light-Six," cylinders 7/8x4¾ inches, 35 H. P., a new four-cylnder chassis, cylinders 4¾x4½ inches, 24 I. P. All the Stevens-Duryea motors have vater-cooled cylinders, working on the 4-troke cycle.

The New Stevens-Duryea 1908 Model X. 5-passenger touring car. Wheel base, inches. Gage 56 inches. Tires all 34x4 inches. Motor 4-cycle water-cooled, four cylind 4¾x4½ inches, 24 H. P. Multiple disc clutch, sliding gear, 3 forward speeds and reverse, be gear to divided rear axles. Brakes, rear hub exterior and interior. No line-shaft brake. Jun spark plugs with dry cells and storage battery. Weight 2600 pounds. Price $2750, including lamps, mats, horn and tools, ready for the road. Cape Top $150 extra. Magneto ignition fit complete $200 extra.

The advent of this Stevens-Duryea, 1908, -cylinder model marks a change in the usiness policy of this large builder of merican cars, altho this 4-cylinder car oes not announce any change of engieering estimates of the relative values of our and six-cylinder motors to be used in igh-class cars priced at $2750 and over. or cars of this size and price, the manageent is fully convinced that the closer pproximation of the six-cylinder motor o constant torque makes it the prime reuisite of touring car durability, comfort, xury and elegance.

There are yet many cars built and sold hich are driven by a single cylinder, than the two-cylinder, and is much costly than the six-cylinder motor, hence must always meet the requirem of those buyers who want something ter than the opposed cylinders motor yet are not prepared to purchase six-inder cars. Fully realizing the prefere of this large class of prospective buy the Stevens-Duryea has made this 4-inder Model X, in addition to its prev line of exclusively 6-cylinder models, ply because the 4-cylinder can be sol a lower price than the six-cylinder mo For all purchasers who desire the car in points of excellence of drive, ability, elegance and luxury, the comp confidently recommends the six-cylin motor as greatly superior to the very four-cylinder that can be produced.

THE NEW 4-CYLINDER MODEL.

The 1908 four-cylinder Model X, is no sense a cheap production. The m is along the latest and best lines of m cylinder gas-engine production, and workmanship is the very best that Stevens-Duryea factory can produce. cylinder bore is ample, and the strok short, giving power, both on maximum partial changes and smooth running at speeds.

The 4-cylinder chassis, construct wheels, axles, speed change, brakes in all details is fully equal to that of

hanical particulars which the Stevens-yea Company desires to publish.

ON THE ROAD.

hursday, November 14, a Stevens-yea "Light"Six" touring car left the ens-Duryea factory at Chicopee Falls, 45 P. M., and was driven thru Spring- and Westfield to Huntington, about 30 miles, at 2.30 P. M.

The day opened with a little snowfall enough to whiten the ground, but the weather cleared as the sun rose, and this "Light-Six" run was made under a blue sky diversified with white clouds, giving an overhead June effect which did not harmonize with the cold November wind

Digitized by Google

something fine all thru this 30 miles, with only one short bit of slightly rough going a little west of the turn under the railway track leaving west of Springfield, and the "Light-Six" made a steady 45-miles pace of it with down-hill glides of better than 50, so that the ride was really enjoyable in spite of the head wind blowing, to which we added our own fast rate going out.

the 30 miles between Huntington an Stevens-Duryea factory in Chicopee.

The Stevens-Duryea "Light Six" h the smoothness of running that c terizes six-cylinder propulsion, and dition to this is on delightfully springs, so that even with our light passenger load the good road and a perfect springs made this swift rush

Stevens-Duryea 1908 Model U 6-cylinder motor, left side, fly-wheel in front, showing piping and Stevens-Duryea own carburetor.

This road is the Springfield-Albany route, and we passed or met several large cars carrying parties of masked tourists, more women than men in furs and goggles, showing the advance in every day motor car use.

At Huntington, in the Berkshire Hills, on the west bank of Westfield river, we warmed ourselves for 15 minutes and made the return start at 2.45 P. M. The smooth road is very crooked, winding among the bleak hills and following the west bank of the river closely to Westfield, where the whips are made.

We were making fast time, averaging nearly 50, as the country is lonely and we had the road free before us most of the

wintry air really delightful. We had wind there was in our faces goin and at our backs returning, which it seem like springtime weather. Th was really not cold, but a 50-mile makes a cooling breeze.

Mr. Taylor is perfectly at home i Stevens Duryea "Light-Six," and int to cover the 30 miles return run minutes when we left Huntington, an well up to his schedule when we ha oiler-shaft stop.

This 60 miles run justified the St Duryea preference for the six-cy motors, as the movement of the "Light-Six" was the smoothest withi writer's motoring experience.

Further, the Goodyear Auto-Tire is **90% puncture proof.**

And to make motoring **absolutely** trouble free—to **eliminate tire trouble** and make any **possible** tire accident **insignificant,** the Goodyear Detachable Auto-Tire on Goodyear Universal Rim **can** be—if ever **need** be—taken off or put on in less than a minute by the watch, by simply loosening one nut with a common wrench and using the fingers for the rest of the simple operation. It is the only rim made **not** requiring **a special** tool, which if lost or mislaid makes it impossible to remove tires owing to all detachable tires now being made with inextensible bases.

Do these things mean much to you, Mr. Motorist, who have probably spent "drudging" hours, or have been delayed, fixing punctures, or failing to fix them, and failing to get the tire off through lack of "required tools"—spent dollars for new tires because flat riding had "rim cut" the old ones to worthlessness?

GOODYEAR

You can't rim cut Goodyear Detachable Auto-Tires on Goodyear Universal Rims.

Nor will they "creep"—"blister"—develop "mud boils"—come off—or do **anything** that good tires **shouldn't** do.

No "ifs"—"unlesses"—"providings" — "exceptings" or "perhapses." Goodyear Detachable Auto-Tires on Universal Rims absolutely **won't** do **any** of these things.

If we could prove each statement in this advertisement, wouldn't you order Goodyear Detachable Auto-Tires on Goodyear Universal Rims right away?

We **can** prove **all**—in this or any other advertisement—any **agent** can and **will** gladly—or **we** will if you'll drop a line to our home office.

We will also show you our extra heavy Clincher Tire, the superior of which does not exist in Clincher style.

We'll show you, also, the 1908 Goodyear Red Seal Brand Inner Tube which is guaranteed for a full year, insuring maximum tire service from Goodyear Tires on Goodyear Rims.

Call and give us the **chance** to prove Goodyear wheel equipment superiority, or write for the free book, "How to Select an Auto-Tire."

e battery, using a 4-coil box on the the right side of the 1908 water-cooled

the exhaust valve is worked thru a push rod and overhead beam. The air-cooled ports are 1 7-16 diameter. In the water-cooled motor, shown in Fig. 4 and 5, the ports are 1 9-16 diameter.

LUBRICATION.

The lubrication for both motors is the same, two splash-pools, separated by one, narrow, splash-fed oil-pool which is constantly filled by the splash and gives flooded lubrication to the middle one of the five crank shaft bearings thru underneath oil holes. Of the five crank shaft bearings, the two end bearings are on annular ball bearings, while the three intermediate bearings are in plain boxes, oiled by independent leads from the three sight feed box placed on the inside of the front board. The lubricating oil is poured

groove in each cylinder, this oil gr being always covered by the piston. splash pits are supplied by drippings the crank shaft journals.

Access to the crank-box is had large hand-holes, with oil-tight co which are secured with a long bar he slots at the ends and fitted with one h screw in the middle.

The valve action, see Fig. 5, is fro single cam shaft, cams applied, pin key retention, with pivoted horizo levers, no rollers, rounded lever-e hardened, resting directly on the c and the valve lifters resting directly top of the lever ends over the cams. top ends of these lifters are fitted spring-plungers, flanged on top to about 1-64th gap before the plunger fl

Fig. 5. Left side of 1908 water-cooled Corbin motor. The valve action is from a single ca shaft with cams primed and keyed in position, operated by pivoted horizontal levers, no rol but with rounded lever-ends hardened and resting directly on the cams. The valve lifters directly on top of the lever ends over the cams. Spring plungers are used at the upper ends the lifters and give silent action. The crank shaft and bearings are of the annular ball ty and the intermediate bearings are plain. The special oiling system is described in the text

into the lubricating oil annular-tank seen at the left end of the oil basin in Fig. 4, and at the right in Fig. 5. From this oil-tank lubricating oil is forced past a screw-regulated opening by-pass to the sight-feeds by a 2-pinion pump, gear-driven from the cam shaft thru light flat-spring drivers, which will yield if the pump offers undue

closes on the lifter top. There is no le adjustment for the valve stems. spring plungers make the valve a perfectly silent and the absence of rollers lightens the cam-moved materially, and so is conducive durability.

A notable feature of this motor is

supply of gasoline, as the angle of the car on the road does not affect the gasoline evel. A drain cock is provided for re-

joints.

The gasoline system consists of a gallon copper tank carried on the rea the chassis and provided with a l funnel shaped filler. On the dash small tank carrying one gallon of g line. An automatic pump operated by haust pressure keeps this small dash supplied with gasoline at a constant l

A multiple metallic disc clutch enc with the transmission and running i oil bath is used. Packing joints prov with glandnuts are placed between transmission chamber and the clutch between the clutch and the outer en the shaft. The number of discs has reduced and the shape of them char which permits a quicker engagemen the clutch while still retaining the lightfully smooth, velvety action. I holes have also been provided for c and examination.

The change speed gear is of the s tive type, four speeds forward and on verse, direct drive on the third sp Ball bearings of large dimensions are and the gears have six pitch teeth. gear ratios have been changed some for 1908.

The lubricating system has not bee tered and consists of forcing oil by a pump from an overflow reservoir belo

Digitized by Google

the bearings. The pistons are lubricated by means of small ledges on the inner edge which catch the oil mist and feed it thru small oil holes to the inner walls of the cylinders.

BRAKES AND CONTROL.

The driving brakes are in dust proof drums attached to the rear wheels, operated by a pedal which interlocks with the clutch and also with the emergency hand lever on the side of the car. In addition, there is an emergency brake on the drive shaft, operated by another pedal independently of the clutch.

Steering is by an irreversible, worm and sector, provided with adjustable stops so as to prevent the tires from scraping the guards or springs. The steering wheel has an aluminum spider fitted with wood grips. The wheels are 36 inches in diameter; 4-inch tires front and 4½-inch tires on the rear.

The axles are one-piece chrome nickel steel I-beam section forgings of generous size; pivots and steering knuckles mounted on D. W. F. ball bearings, with hardened steel bushings, and provided with compression grease cups. The spark and throttle control levers operate as usual on a stationary sector on top of the steering wheel and are finished in dark gun metal, and tipped with horn handles. An accelerator foot pedal is also provided.

BODIES AND EQUIPMENT.

The touring car body is made of prest steel, with roomy double side entrance tonneau, fitted with individual folding seats. The edges of the tonneau are trimmed with hand-polished "Cuban Sabique." Under the driver's seat and opening into the tonneau is locker room for two dress suit cases. A folding foot rail is also provided and also a fine thick cocoa mat. The space under the rear seat is available for luggage. The top door handles are trimmed with horn, and the side handles covered with seal leather. A double folding robe rail covered with seal leather is also provided.

The touring runabout body is of new type, and is fitted with a double detachable rear seat. The engine and body are well back on the chassis, and the steering post extends backward in a very comfortable position. The rear seats may be detached and an artillery box can be substituted. The tools are carried in drawers under the driver's seat owing to the shorter running board.

The hood and guards are both made of aluminum with reinforced steel edges.

The equipment consists of two large acetylene searchlights, two side oil lights, a rear signal light, acetylene generator, complete equipment of tools, an extra set of spark plugs, all carried in a large steel tool box attached to the left running board. On the right running board is another steel box which carries the storage battery and clutch and engine oil and bearing grease. The pump, jack and repair kit are all in the tool box. An extra large French horn is also supplied.

For Uniform Motor Car Laws

The proposed uniform State act which was drafted and submitted by Chairman Terry at a meeting of the Legislative Board early in the present year has been redrafted and will be in its final form prest for passage in those States where at present the laws are undesirable and oppressive.

In preparation for the campaign in behalf of the Federal bill, literature in the form of letters has been prepared, to be distributed by the automobile clubs and their members thruout the country and by individual automobilists not connected with any club, not only among other automobilists, but among all classes of citizens, urging them to communicate directly with their Congressmen in support of the bill and to secure the favorable action of the committee and of Congress upon the measure.

Meeting of the A. A. A. Racing Board

At the meeting of the Executive Committee of the Racing Board of A. A. A., held in New York City, November 27, the following resolution was adopted:

"Resolved, That it is the sense of this meeting that the Racing Board approve the sportsmanlike action of the Automobile Club of America and the Florida East Coast Automobile Association, in their endeavor to resuscitate high class racing on the Ormond-Daytona Beach, and further, we assure both clubs of our hearty and earnest support."

After the other routine business was considered, the meeting adjourned, and then reconvened as the Vanderbilt Cup Commission, and adopted a resolution to the effect that the William K. Vanderbilt, Jr., Cup Commission promote a race for the William K. Vanderbilt, Jr., cup during 1908. The date of competition, the rules governing the competition, the entry blank, the form of declaration and the course will be announced by the Commission by July 1, 1908.

George H. Day Dies Suddenly

Mr. George H. Day, one of the founders and for many years the moving spirit of the Executive Committee of the Association of Licensed Automobile Manufacturers, died suddenly of heart disease at Daytona, Fla., on Tuesday, November 21. The death of Mr. Day came as a shock to the entire motoring world, which mourns the loss of one of its greatest benefactors.

e F. A. Brownell Motor Co., Roches-
N. Y., U. S. A., successors to Brown-
rebert Company, Rochester, showed
ie New York Palace Exposition four
rs, from 4-cylinders, 34 H. P., to 6-
ders, 80 H. P.

e F. A. Brownell Motor Company,
alized at $400,000, took over the busi-
of Brownell-Trebert Company in Oc-
, 1907. Brownell-Trebert Company
formed in February, 1906, to exploit
e of motors previously developed, and
successive organizations mark ma-
changes and improvements which
brought the 1908 Brownell motors up
e very latest practice in gas engine
ruction up to 160 B. H. P.

The Brownell 1907 Palace exhibit included 3 models of 6-cylinder motors, cylinder respectively, 4x5, 4½x5, and 5½x6½ inches. Of these three 6-cylinder motors the intermediate and largest are the latter designs with valves in the cylinder head, overhead beams and cam shaft in the motor base. The smallest size 6-cylinder model has an overhead cam shaft with the valve operating bell cranks all hung on a common stationary shaft directly above the cam shaft, one cam for each valve. This form of all overhead valve motion has advantages, and is largely used, and will be continued for some time, altho certainty of lubrication, protection from dust and ready accessi-

supply, ignition either double or sin-

of the motors has single unit cylin-
all the others have the cylinders

bility lead the Brownell engineers to prefer placing the cam shaft in the crank box, covered by a full length hand plate which perfectly encloses it, but can be quickly removed, giving free access to the cams and cam rollers. The cam rollers are in forked horizontal levers, all hung on a common rod, placed opposite the cam shaft inside the motor base. This horizontal roller lever relieves the cams of the work of moving the valve lifters, and greatly increases the valve action durability. The lever lifter rods have a screw length adjustment at the top, check nut retained, making it easy to adjust the valve action clearance so as to pre-

Hosted by Google

lengthwise port bridges, about ¼-inch thick, which equalize the valve and valve seat wear on the port and entire wall sides. This port bridge is an unusual feature, and is regarded as highly valuable by the engineers of the company.

All crank boxes are aluminum castings, divided horizontally in the plane of the crank shaft axis, and are capt underneath, all free from the oil basin underneath, which has no oil pits.

Fig. 2 Front view of the 4-cylinder 1908 Brownell motor. This view shows clearly the overhead rockers which operate the valves, both the oil and water pumps and the secondary distributor.

The lubrication is by one oil lead to each cylinder and one oil lead to each bearing, force feed, with a sight for each oil lead, and drainage from the oil basin to an oil well whence a single oil force pump returns the oil to a single air-tight, overhead chamber thru a large strainer, giving a strong air pressure on the oil reservoir. The feed sights are placed at the oil lead terminations, making the oil supply everywhere visible.

The connecting rods are all steel drop forgings. The piston pins are hollow, very

inside and out, rods symmetrical, bodies in middle of wrist bearings, al boxes closed on thin liners, to take u removing one or more liners, without ing to depend on accurate workman in removing metal to preserve the rod parallelism.

The pistons are packed with three rings each, all above the piston pins. crank shafts are high carbon steel, a ample diameter and are finished by g ing.

THE GEARING.

The half time gears consist of a pinion applied to the crank shaft wi bronze pinion on the cam shaft. A c in bevel gear at the cam shaft front outside the crank box, drives a ver shaft carrying the commutator on its end and driving the two pinion oil pump at its lower end. The cam mitre gear meshes with four pinions, ing two horizontal and two vertical drives; one of the horizontal shafts d the rotary water circulating pum slotted eccentric disk with 3 radially ing pistons. The other horizontal s on the cam shaft side, may take the mutator if desired.

THE WATER COOLING.

This rotary pump displaces a large ume of water per revolution, and a the water jackets are unusually long. cylinders and entire water jackets ar tegral castings, which ensure perman water-tight construction by avoidin water-jacket packing.

EXHAUST COOLING.

The Brownell dual cylinder units the two intake valves in the middle, the two exhaust valves outside of t This gives water jacketed exhaust sages long enough to be effective in ing the exhaust before it reaches th terior exhaust piping. The rapid circulation and ample water jacket make this exhaust cooling in the cyl head jacket practicable.

THE CARBURETOR.

This is a new design for multiple der motors, a single float regulatin gasoline level for two stand-pipes o diameter and form throats, with a rate automatic auxiliary air intake each stand-pipe, for 4-cylinder motors three stand-pipes, same adjuncts for for 6-cylinder motors. This gives a tually independent carburetor for pair of cylinders employed, a carbu arrangement before tried and disc

Digitized by Google

ts own individual adjustment in its threaded sleeve, so that the fuel supcan be independently regulated for pair of cylinders at first, and this ate adjustment can be retained. , by moving all the externally ded needle valve carrying sleeves to-

num casting gear cases, unless otherwise ordered. The sliding gears, all Brownell designs, are made by the Brownell factory.

THE MARINE REVERSE.

This reversing clutch consists of an internal expanding bronze ring in a slightly

Fig. 3. Exhaust side of the 6-cylinder 5½x6½ Brownell motor. Note the compact cylinder ngement; the large hand holes and the peculiar exhaust pipes, the exhaust valves being r jacketed, the small water pipes showing between the pair of cylinders.

r, the one movement can perfectly rn the fuel supply to either 4 or 6-der motors, with either two or three ate stand-pipes, needle valves and iary air intake valves, all as perfect-if only a single stand-pipe and needle were used.

e motors are fitted with either cone ultiple disk clutches, or special types utches to purchasers' own drawings

eccentric, internal, cylindrical seat, bored in the fly wheel. When the internal bronze ring is collapsed the engagement is gradually effected and is frictional, but when the bronze ring is fully expanded it must be sheared by the fly-wheel before the clutch can let go, thus obtaining all the advantages of both the friction and solid jaw clutch.

The Dietz "Sentinel" Tail Lamp

e Dietz Sentinel tail lamp is a late ion to the Dietz line of lamps, manured by the R. E. Dietz Co., 60 Laight t, New York City, and is made for use

volt electric bulb, as ordered; 2½-inch reflectors, 3-inch white and ruby lenses, and a combination socket. The price of this lamp is $3.25, for acetylene type, and $3.75 with electric attachment.

Michigan Auto Company to Build Only Special Automobile Parts

It is probably not universally known in the trade that the Michigan Automobile Co., of Kalamazoo, Mich., has given up the manufacture of complete automobiles, believing it to be more to its advantage to specialize on the manufacture of parts. To this end it has been for the last two years or so shaping its business toward doing special work, and is now prepared to make, from special designs or samples to be furnished, any style of gas engine from one to six cylinder, and any type of

Conn., U. S. A., was established in 1853, and began a general foundry and machine business which developed two specialties, mining machinery and steam fire engines. The business was incorporated in 1903, $200,000 capital stock, a close corporation, with William E. Burnham, formerly of the long-established hardware firm of Eaton, Cole & Burnham, as president. The Pacific Iron Works took up the gas engine car motor in 1907, and is now offering a wide range of 4 and 6-cylinder motors, both air and water-cooled.

The smallest, lightest and lowest cost Pacific motor has four cylinders, air-cooled, rated at 26 H. P. The cylinders are 4¼x4½ inches, with rods 10 inches center to center, with crank shaft wrists

motion is vertical lifting rods, scre
justed for length, to long and short
overhead. The beam connections all
tapered pin, hardened joints, adjustab
wear. The cam shaft gear, interme
and crank shaft pinion are all hard
run in oil, and make no noise.

LUBRICATION.

Two distinct oiling systems are op
with any of these Pacific motors, on
tem a force feed to each cylinder, th
supplying the crank pits, no ov
stand-pipes and no return. The oth
ing system is a separate oil pit and
pipe for each cylinder, all overflow
oil well, which is sucked by a force
delivering oil thru unobstructed lea
each crank shaft journal, the drip

The wrist boxes are Par- white bronze, finished all over, split closed on 2, 5 and 10 thousandths liners, same as the crank shaft s.

PISTONS.

e Pacific pistons are all same general truction, four eccentric snap rings, lap, all above the pins. The piston are cylindrical, hollow, hardened and nd, retained with tilt screws which

Fig. 2. Pacific Iron Works 1908 air-cooled motor, oblique view from above, showing the ar disposition of the long and short, valve-actuating, over-head beams. All the valve lever rod joints are taper pins or studs in taper seats, with screw adjustment to take up lost ion.

retained with 3-16 diameter split pins the screw heads, the pins being long gh to keep the screws from slacking The pistons are 3 cylinders in form, head above the rings is 5 thousandths l, then three thousandths small to bottom of the rings, and finally 1 sandth small to the piston bottom

e total weight of this 26 H. P., air- ed motor, is 390 pounds, including pip- carburetor and fly-wheel.

e small water-cooled motor is 4 cyl- rs, same bore and stroke and general r construction as the air-cooled de- ed. The water circulation is by a ro- pump, eccentric, with one sliding pis- This small water-cooled motor has ounds compression, and is rated at 28 P., 1000 R. P. M., standard Pacific e test velocity. The weight is 390 ds; price on application; same price

liner assembly. All crank box bolts g clear thru the motor base, bolt heads o top of base, between the cylinders, cas telated check nuts and split pins below.

The Pacific larger sizes of motors, ger eral construction as here indicated, ar as follows: Four cylinders, water-cooled 5x6 inches, 40 H. P., weight 520 pound everything on, including the cone clutch Six cylinders, 4¼x4½ inches, water-cooled 40 H. P., weight about 550 pounds, wit cone clutch. Six cylinders, 5x6 inches water-cooled, 60 H. P., weight, without th clutch, 600 pounds.

It is the intention of the Pacific Com pany to produce a line of well built ca motors at as low a price as good design material and workmanship will permit, i large numbers, to meet the requirement of motor car manufacturers.

The cylinders are bored and reame cold, and then finished by grinding whil heated by gas burners to working tem perature.

The pistons, piston rings, crank shaft and valve action parts are finished b grinding, and nothing is spared in pro ducing these Pacific motors in form t stand up under hard work and satisfy pur chasers.

The Pacific Iron Works has its ow foundry and chemist, and analyzes every heat, keeping its cylinders to very nearl a constant mixture, running one cupol on cylinders only.

tment. The exhaust manifold gradu-
y increases in size from 1½ to 3 in-
es. All bearings, both connecting rod
d journal bearings, are of nickel metal
de in steel moulds under a 150 pound
pressure. The piston pin is held in
ce with a steel snap ring, thus guard-
against any possibility of the piston
working out and cutting the cylin-
r. The pistons are also turned on the
ide in order to guarantee pistons
ighing the same in every case for a per-
ct balance. The manufacturers guar-
tee not only the bearings but every part
the engine, including pistons, piston
gs and cylinders to be absolutely inter-
angeable. In other words, any piston
ll work as well in one cylinder as in
other; the cylinders may be changed
m one place to another without filing
fitting.

yton Folding Tonneau for Cadillacs

We show herewith a new folding ton-
au brought out by the Dayton Folding
nneau Co., 1143 North Main street, Day-
, Ohio, for the Cadillac single cylinder
nabout. The cut shows the body in
en position, while in folded position it
esents the same neat appearance as seen
other models manufactured by this con-
rn.

The Dayton Folding Tonneau Body for the Cadillac Single Cylinder Runabout, shown i
pen position.

This body fits the chassis without any
eration whatever, and all fastenings are
nished with it, so that there is no ex-
expense. The tonneau latches tightly
en closed, so that there can be no clat-
when going over rough roads, but it
be easily opened in a few seconds to
at the engine or to provide extra seats.
e body is painted and upholstered to
tch the chassis. The leather used is
the highest grade, and extra care is
en with the painting. At first these

ity of the battery.

he containing case consists of a sub-tial wooden box, having locked corners rabbetted bottom. The bottom is in parts tongued together forming an ex sion joint which compensates for any lling, or shrinking of the wood caused moisture. Before the cells are assem- in this case it is given two coats of acid-resisting paint, and a third coat he same paint is given the completed ery.

he jars in which the elements are as-bled are composed of hard rubber, and set into the box with sufficient clear-e to allow for a special compound to oured between them and the case, al-ng no space for acid to creep down in- and destroy the wooden case. This pound also materially strengthens the and in case of a cracked jar reduces liability of leakage.

he elements used are the Standard ide" plates, assembled with specially ted wood diaphragm separators.

he connectors between cells consist of ubstantial pillar strap, of a tough, tic and thoroly acid-resisting metal,

model has been superseded on the 19 model, by a handle composed of rubbe webbing, which has proved to be mo durable.

The "Add-Wear" Steel Belt

The Add-Wear steel belt is adapte specially for fans or oil pumps. It manufactured by the Adwear Auto Ti Sleeve Co., North Attleboro, Mass. It ca be instantly put on or removed. On a

The "Add-Wear" Steel Belt.

count of its peculiar construction it has tendency while in use to cling firm against the pulley and yet may be instan ly removed. The couplings are guarantee against breakage. The list price of th belt is $1.50.

New 1908 "Van" Jacks

Two of the latest types of automobil jacks offered by the Vanderpool Bros Springfield, Ohio, are their models No 1 and 3, here shown.

The Van No. 1, is made of malleabl iron and its raising screw is cut from ¾ inch round cold rolled steel. A pocket cast inside of the stand to hold the turnin lever which is made of cold rolled stee This model weighs 4¼ pounds and wi raise any car with 28 to 34-inch wheel It lists at $1.75.

"Van" Jack, No. 1. "Van" Jack, No. 3.

The Van No. 3 is also made of malleabl iron and has a large 3¾-inch by 5⅞-inc base, which makes it very desirable fo touring cars. The jack raises the car onl on the downward movement of the leve the upward stroke being perfectly free.

ne of the principal merits of this type f fastener is its simplicity, and that it is ire to work. Another advantage is the act that it can be worked with a gloved and, or even if the hand is covered with mitten, so that it is not necessary for he car user to remove his gloves or mitens and get his hands cold on a wintry ay. A cross piece is pivoted in the slot

The Sprague Single and Double Curtain Fasners.

the end of the main portion of the fasener, and this cross piece can be swung a position in a line with the main part the fastener, so that the grommet will ide over the whole thing, and the cross iece is then swung into a position perendicular to the main part of the fasten-, and in this position prevents the curin from becoming loose, as shown in the lustration. To unfasten the curtain it is nly necessary to push back the grommet nd reverse this operation.

Trade Printed Matter

The Imperial Brass Manufacturing Co., 241-9 South Jefferson street, Chicago, have issued r 1908 a much more elaborate catalog than ny heretofore sent out by them. It contains pages in a rich purple and orange cover. A erusal of the book shows that many additions ave been made to the Imperial line for 1908.

Charles H. Besly & Co., 15-21 South Clinton reet, Chicago, are distributing an attractive lite booklet on their "Helmet" oils for motor r and other uses. Its pages are livened up the use of small illustrations of out-door enes having special reference to the particular urpose to which the various lubricants are put.

Two booklets have just been issued by Zoar attery Co., of Zoar, O., one a catalog of prices, ecifications, etc., of the various types of Zoar

and the decorative illustrations, and the general tone of the book is one of ext elegance and refinement. Four distinct ch are described on each of which various typ bodies are fitted, making in all a line o models.

The 1908 catalog of A. N. Parry & Co Amesbury, Mass., shows that they have larged their line of automobile specialtie quite an extent. The catalog, which con 80 pages and cover, is devoted to both car and automobile fittings, such as canopy standards, bow separators, curtain fasteners terior lights, hardware, and similar goods

Standard Welding Co., Cleveland, O., ha sued a little booklet illustrating several of many types of seamless steel rims which it ufactures. This company has made over 20 ferent styles, but owing to certain trade c tions has not been permitted to catalog majority of them. The booklet just is shows that the Standard Company has the ity and proper equipment to produce all and shapes of rims for all kinds of ve wheels.

A treatise on carburetion and the 2-motor has been published in pamphlet forn E W. Stevens, M. E., East New Market, designer of the Stevens carburetor. It is a cital of the author's experience and the de tions therefrom in perfecting the Stevens buretor and making it suitable for use in co tion with two-cycle motors. A sectional half-tone and a line cut are used to illus the explanatory matter.

"As they Come to Us," is the title of a lately issued by Woods Motor Vehicle Co Chicago, Ill., and containing a number of monials selected at random from the many ceived from pleased users of Woods electric gasoline cars. The letters are reproduced in act fac simile, and they indicate that W cars have been giving perfect satisfaction many years.

"Mesinger" Inside Tire Repair Ba

The H. & F. Mesinger Manufactu Co., 1801-1807 First avenue, New Y City, well-known manufacturers of shoe repair bands, saddles, etc., have cently added to their line the new in tire repair band, here shown.

This band is made of extra str fabric, has beveled edges, and is mou to fit the inside of Clincher, Dunlop

The "Mesinger" Inside Tire Repair Ban

Fisk tires. The hooks can be bent to the different styles of casings to prev creeping. This band is made exactly the same principle as the inside of a ular tire, and will repair blow-outs, cuts and other defects of the casing. sizes and prices are as follows: 3 and inches, $2.00; 4 and 4½ inches, $2.50, 5 and 5½ inches, $3.00.

main claims of superiority made for it that it will positively not sulphate, and the chemical treatment of the active erial used in it precludes any possi- y of its becoming dislodged.

rior View Geiszler Storage Ignition Battery.

of perforated hard rubber and ribbe wood, which also precludes any possibi ity of short-circuiting by direct contac The sealing of the separate compartment is made, first by an inner hard rubbe cover; second, a thick layer of sealin compound, and third a master cover o hard rubber over all compartments, whic insures both acid and water-tight cor struction. The vents are so constructe as to allow the free escape of the gases and by means of the indirect openings ef fectively prevent both evaporation an spilling of the acid.

All the screws in the terminal bindin posts are heavily silver plated to preven corrosion. The nuts and cell connector are made of a special composition of an timonious lead, which is unaffected by aci and sufficiently hard to properly perforn its function. The handle is made of Ger man silver wire, and is covered with rub ber tubing. It is sprung into place i cavities drilled into the sides of the carry ing case, and may be readily removed i occasion requires.

Size 66 is 5⅝ inches long, 7¼ inche wide, and 8 inches high, and weighs 2 pounds. It lists at $15.00. Other sizes ar made from 20 ampere hours, 6-volts, listin at $11.00 to 80 ampere hours, 6-volts, lis ing at $22.00.

"Non-Freeze" Radiator Solution

"Non-Freeze," for automobile radiator is manufactured by the Pierson Moto Supply Co., 43 Cortlandt street, New Yor City. It is said that it will not freeze a 20° below zero, and will not evaporat It is sold in powder form in 10-poun cans, this quantity being dissolved in 1 quarts of warm water. The can lists a $2.00.

The New Departure Mfg. Co., of Bristo Conn., demonstrated the efficiency an strength of New Departure Two in On annular ball bearings at the shows by run ning 1000 pounds wheels on both radia and end thrust types of these bearing One wheel was placed horizontally for de monstration of the end thrust type, an the other vertically to show the efficienc of the radial type.

The Warner Instrument Co., of Beloi Wis., has moved into its new factory i that city. The buildings are of reinforce concrete construction. The main buildin is 100x200 feet in dimension with the roo

THE $2000

THE STANDARD OF AMERICAN AUTOMOBILE VALUE

Mitchell

Perhaps you've noticed that most cars cost more than the Mitchell.
Did you ever notice that they were any better in finish or in material—or any better in **performance**—on the road?
Ride in a $2000 Mitchell and **see.**
Have any Mitchell agent "show you" a Mitchell.

Look it over—go out into the country and test it on the toughest hill you know of—through some particularly bad stretch of sandy or muddy road. Notice your power—notice speed—notice the sweet running motor—the tranquil action of all moving parts—ease of control—notice general efficiency, Mr. Prospective Owner.

Then if you can see how you'll get two or three thousand dollars more automobile value out of any other car—**buy** the other car, we won't say a word.

But you won't **find** more value in any other car.

Present day automobile value is **standardized in** the **Mitchell** at **$2000.**

A demonstration will prove this to **you.**

You are under no **obligation** to buy when you ask for a demonstration.

If you are considering the purchase of a car we want you to **know** the Mitchell, and we want **to show** you what you get in a Mitchell at $2000 and that you can't get any **more** in **any other** car, **regardless** of the price.

Call up the Mitchell agent.

. Murray Automobiles & Bicycles, Bloomington, Ill.

L. Murray, 215 Main street, Blooming-Ill., agent for the Cadillac cars in that tory believes that individual efforts responsible for the majority of sales e. No special advertising or stunts resorted to, but prospective customers aught by demonstration the operation e car and all the details of construc- are fully explained. A regularly ot garage with light lathe grinders and ng apparatus, etc., for repair work is ated. Second hand cars are not traded nless in exceptionally good condition the company can figure on a fair profit oing so. Salesmen are employed on y and must be strictly honest in all ngs.

garding the question of the better- of the agents' condition, Mr. Murray s that a great deal of worry could be d the dealer if the factories would up their gigs and tools, so parts ed from time to time would require lutely no fitting. All parts should be to limit gages and thoroly inspected ee that they do not exceed the per- ble variation.

Keep in Touch with Customers

e Smith Auto Company, of 1420-22 t Place, Denver, Colo., with Arda k, president and manager, is repre- ng the Great Smith roadster and ng car. Daily newspapers, theatrical rams, making record runs, getting paper notoriety, making the cars lar and showing the people what the vill do are the methods of advertising oyed. The company states that most s customers come from individual ef- altho advertising helps a great deal. sales have been made the company s up a friendly correspondence with customer to cultivate his acquaintance, watches his car and keeps it in ad- nent believing that it will keep the haser in a better frame of mind to mmend the local firm as well as the them after business hours at which time their minds are free from business cares The company thinks that it is the best time to interest a man in an automobile A well equipt garage and repair shop is operated, but very little trading in or second hand cars is done, as it is a poor business for dealers.

Cuts Out Joy Riding and Liquors

Fred S. Smith, of 38 Columbus avenue Boston, Mass., agent for the Autocar and Apperson cars in that city makes some terse statemnts in regard to his method of conducting business. Altho he does not conduct a garage he has a good shop equipt with a full line of machinery for taking care of repair work. Very little business is done in trading in second handed cars.

Mr. Smith states that his success in the automobile business is due mostly to individual efforts. It is his opinion that in order to better the trade conditions for the dealer, it is necessary for them to cut out Sunday and night work, joy riding and liquors.

Salesmen should be employed entirely on a salary, as it will save dispute and jealousies and all he believes will be more likely to work for the common good. Mr Smith's requirements for a salesman are honesty, politeness, sobriety and the devoting of business hours to business.

Grafting chauffeurs are cut out entirely

A Dealer's Unique Method

Julian F. Denison, of New Haven, Conn. local agent for the Atlas motor car has adopted a unique method, showing the comparative action of the four and two cycle engine. He has installed in the window a model showing a sectional view of the 2 and 4-cycle types of cylinders with spark plugs connected and the space where the explosions usually occur covered with a ground glass plate behind which incandescent lamps flash at the proper intervals, giving the appearance of an explosion in the cylinders. The model is run by an electric motor.

Digitized by Google

vithout the model necessitated in many ases much time and repeated explanaions.

The Lemont Motor Car Co., Worcester, Mass.

Mr. B. A. Lemont, manager of The Lemont Motor Car Company, 6 Tirrel Street, Worcester, Mass., writes us that ltho the company acts as agent, its prinipal business for the past four years has een the renting of automobiles. With eadquarters in Worcester the company onducts a rental business at Ormond Beach, Florida, during the winter, January o April, and at Bretton Woods, N. H., uring the summer, July to October.

In the past, five makes of cars have been sed in the service, but in the future the Elmore cars will be used exclusively, the ompany now having the agency for this ar in Worcester Co., Mass., Volusia Co., Fla., and Britton Woods. N. H. The garage at Worcester is maintained all the ear round and at the season resorts the ompany sell and operated the large garages of the Hotel Ormond at Ormond Beach and Mt. Washington and Mt. Pleasant Hotels at Bretton Woods, N. H.

E. P. Moriarty & Co.'s Garage, Kansas City

The E. P. Moriarty & Company, of Kansas City, Mo., under the management f E. P. & J. T. Moriarty, is conducting the agency for Packard, Stevens-Duryea & Woods Electric, at 1610 Grand avenue. The company does not do any storage busiess but has a well equipt repair shop where it repairs only the cars that it andles. The company's success in selling ars is attributed both to individual efforts nd newspaper advertising. The company nakes a specialty of frequently placing pecial want ads in the papers.

The card system of follow up is employed and after purchases have been nade the owners are supplied with written nstructions on all special points in care f cars, winter use, etc. Demonstrations nd visits are made by the salesmen who re employed on a salary only and who are equired to give every one a square deal. Grafting chauffeurs are an annoyance which the company has been fighting for he past two years.

Hotel Walton, December 3. Reports that the association is in a first class f cial condition. The membership has increased. Altho the show was held n earlier this year than ever before the s committee's report indicates that it a success and this year yielded la profits than ever before. The "Two-in-One" Power Opera Hack Saw

Buffalo Specialty Manufacturing Buffalo, N. Y., recently placed on market a new power operated hack called the "Two-In-One." This hack has been designed to perform the wor two ordinary single blade outfits, b provided with two blades, one at end; but as both are driven from one and operated by one set of moving p space and installation cost are econom and other advantages obtained not curable were it necessary to install single machines. The saws can be ated separately or simultaneously.

The "Two-In-One" Power Hack Saw

The wear on the saw blades is red to a minimum, as the pressure on san only applied while they are making cutting strokes; while on the re stroke when no work is being perfo the blades run free of pressure. I therefore claimed that the life of blade is doubled.

When the saw has cut thru the being sawed an automatic shut-off de instantly stops the saw and prevents necessary wear.

The vises for holding material t sawed are fitted with swivel jaws, w adjust themselves to hold pieces of

Retail Notes

Aubel & Wood, Akron, O., are erecting a new brick and concrete garage on East Buchtel avenue, near Main street.

B. & H. Motor Car Company has recently opened a garage 147-151 W. Forty-ninth street, New York City.

Botterill, Tom, of Salt Lake City, Utah, agent for the Babcock electric car, has been given the agency for the Babcock car in Denver, Col.

Battle, Edwin A., has opened a new garage and repair shop at Third and Scott streets, Little Rock, Ark.

Brock Automobile Garage, on Canal street, north of East State street, Trenton, N. J., has recently opened for business.

Corn Belt Auto Company, Waterloo, Ia., will move into its new quarters on East Fifth street, where it will conduct an up-to-date garage and repair shop.

Electrical Garage Company, 128 Columbia St., Utica, N. Y., incorporated early in September, has removed to 7 Court street, where it has more commodious quarters. This company makes a specialty of the storing, charging and repairing of electric carriages only.

Felker's, W. B., garage business in Denver, Col., is being continued by Delia W. Felker. Mr. Felker was killed in a racing accident on Labor Day.

Flynn, Walter, has disposed of his Wick avenue garage at Youngstown, O., to Kleese & Wick.

Hosterman, A., South Bend, has moved his garage and repair shop from 309 North Main street to 205 North Main street.

Joo, Raymond S., has closed his garage at 79 Orange street, Newark, N. J., and become identified with the Roseville Motor Car Company.

Koch, William, will erect a two-story garage 30x120 feet at 223-225 North Sixteenth street, Philadelphia, Pa., to cost $7,500.

Kohlhuss Motor & Parts Company is the style of the new concern recently opened up in Cleveland, Ohio, as manufacturers agents at 1918 Euclid avenue.

Monte Cristo Garage is the name of the new $12,000 building now in course of construction in New London, Conn., and will be operated by James O'Neil and James F. Sullivan.

Maltby, W. S., of Plainfield, N. J., has taken the Essex county for the Corbin cars, and will open salesrooms in Newark.

Mack & Brooks, of Lima, O., have purchased the $12,000 Ashton lot on W. Market street, and will erect a large garage thereon.

Mosehart & Keller Automobile Company is the style of a new company recently formed in Houston, Texas.

Newby Automobile Company, of New Castle, Ind., has been organized and incorporated in the sum of $15,000, and will shortly take over the retail business of J. A. Newby.

Nock Automobile Co., E. L., Providence, R. I., will build a new garage on Broad street, near Potter avenue.

Olson & Johnson have opened a garage and repair establishment at 1722 West Superior street, Duluth, Minn.

Owens & Co., Allen W., Baltimore, Md., is enlarging its garage on Preston street, near Charles, which when completed will contain three times its present floor space.

Palethorpe, J. E., will erect an addition 30x80 feet, to his garage at Kokomo, Ind.

Powell Automobile Company, of Omaha, Neb., has sold its automobile business to H. E. Frederickson, and increased its jobbing business. The Powell Company's new address will be 2010 Farnam street.

Pratt, C. B., has opened a large garage in Weymouth, Mass. It is located on Water street.

Park, John A., of Raleigh, N. C., has secured the agency for the Ford car in that place.

Ranger & Barrett Co., is the style of the new concern which has taken over the garage business of W. C. Thornhill, 310 Tenth street, Minneapolis, Minn.

Schaefer, W. E., Ripon, Wis., will open a garage in his building on Jackson street, where he will carry a full line of auto supplies.

Smith & Euwer will construct a garage on West Rayen avenue, Youngstown, Ohio.

Smith Bros., of Los Angeles, Cal., have been appointed agents for the Rainier cars for southern California.

Agency Notes

Northern Motor Car Company, of Detroit, Mich., maker of the Silent Northern, has assigned the following 1908 agencies: Copeland & Taylor, Pontiac, Ill.; C. W. Evans, Dixon, Ill.; Noah Keeler, Wallace, N. Y.; A. H. Ritter, Iola, Kan.; Enid Auto Company, Enid, Okla.; Wilson Auto Company, Wichita, Kan.; Huron Auto & Electric Company, Port Huron, Mich.

The Corbin Motor Vehicle Corporation has recently established the following agencies: Reese Motor Car Co., Cleveland, O.; Corey & Wallace Motor Co., Portland, Ore.; Pacific Coast Automobile Co., Seattle, Wash.; Inland Auto Co., Walla, Walla, Wash.; B. C. Bernard, Troy, N. Y.; Carlton Garage and Repair Co., Brooklyn, N. Y.; Clark & Davis, Syracuse, N. Y.; Wierick Bennett Auto Co., Sioux City, Iowa; Bell Bros., Stanford, Conn.; Bridgeport Auto Co., Bridgeport, Conn.; New Haven Auto Corporation, New Haven, Conn.; the E. H. Towle Co., Waterbury, Conn., and Pyramid Motor Car Co., Danbury, Conn.

The Dragon Automobile Company, of Philadelphia, has signed agency contracts with the following: W. F. Rabenold, Allentown, Pa.; Gate City Motor Car Company, Atlanta, Ga.; Mohler & DeGress, Mexico City; Carrington Auto Company, Carrington, N. Dak.; L. W. Pipher, Stroudsburg, Pa.; Indianapolis Motor Company, Indianapolis, Ind.; Crescent City Auto Company, New Orleans, La.; Dragon Automobile Company, Boston, Mass.; American Garage Company, St. Louis, Mo.; Dragon Auto Garage, of Hudson County, Hoboken, N. J.; United Motor Car Company, Cleveland, Ohio; W. B. Brown, Pittsburg, Pa.; Louis Erickson, Seattle, Wash.; Eby Manufacturing Company, Lincoln, Nebr.; Wm. H. Franklin, Hightstown, N. J.; Branstetter Motor Company, Chicago, Ill.

The Forest City Motor Car Company, manufacturers of the Jewel cars, at Masillon, O., has established the following agencies:

M. L. Robertson, Cullman, Ala.; Freeman-McCabe Co., 455 Golden Gate avenue, San Francisco, Cal.; J. B. McIntosh Auto Co., 199 Jefferson avenue, Detroit, Mich.; O. E. Goodenough, 280 State street, Rochester, N. Y.; Jewel Automobile Co., 487 Sterling place, Brooklyn; D. B. Smith & Co., Utica, N. Y.; Shelby Machine & Supply Co., Shelby, N. C.; F. L. Manning, Merna, Neb.; A. L. Hoover, 1720 South Seventeenth street, Lincoln, Neb.; York & Spenny, 1305 North Broadway, Oklahoma City, Okla.; W. H. Wolfe, Del Rio, Texas; R. H. Magoon Motor Car Co., Cleveland, O.; D. S. Hoover, Crestline, O.; N. W. Neptune, Londonville, O.; G. L. Wirick, Pemberton, O.; Archer & Clark, Farmers Station, O.; F. Roosa, Conneaut, O.; W. D. Hoge, Rayland, O.; E. V. Hall, Convoy, O.; Frank Geis, Warwick, O.; Andrews & Fite, Georgetown, O.; W. A. Robinson, Steubenville, O.; Malcolm Newstetter, Reading, Pa.; G. A. Wynn, New Florence, Pa.; J. C. Moore, Saltsburg, Pa.; R. J. Goodell, Putney, Vt.; Porter-Cowper & Co., Norfolk, Va.; Branson & Janda, corner Nineteenth and Ferguson streets, Cheyenne, Wyo.

Mr. F. B. Cole, for three years past foreman of the repair shop of the H. H. Franklin Mfg. Co., Syracuse, N. Y., has accepted a position with the Boyer Motor Car Co., San Francisco, Cal.

February 20-March 7—New York City, Madison Square Garden, Fourteenth Annual Motor Boat and Sportsmen's Show.

March 16—The Fourth Annual Motor Boat Carnival at Palm Beach, Fla.

April 6-11—Buffalo, Convention Hall, Motor Boat and Sportsmen's Show. D. H. Lewis, Mgr.

Motorboat and Sportsman's Show

The 14th annual Motorboat and Sportsman's Show is to be held this winter in the Madison Square Garden, February 20 to March 7. Arrangements have been made on an elaborate scale and will be under the management of Captain J. H. Dressel. The exhibits will be, as usual, large in number and varied in character. Several changes will be made in the arrangement, notably the lake will be shaped like the letter C, with turns at each end, providing a long waterway, 15 feet in width.

The New York Motor Boat Show

The first exclusively motor boat show ever held in this country opened its doors to the public in Grand Central Palace, New York City, on Saturday, December 7, under the auspices of National Boat and Engine Builders. A survey of the exhibits showed that great progress has been made during the past year.

The various sections of the building in which the exhibits were placed were handsomely decorated with flags and streamers, and the stands were well lighted and decorated. The exhibitors numbered one hundred and four, ranging from the large forty-foot cruisers, smaller power boats, down to canoes and internal fittings, which latter were so caried as to suggest that there could be no limit to them.

The straight knife-like bow which allows the water to fall on board, drenching the occupants, has given way to the flaring bow which throws the spray from the hull.

Great interest was shown in the exhibits of the big cabin cruising power boats, shown by the Racine Boat Manufacturing Co., Matthews Boat Co., and the Truscott Boat Manufacturing Co.

The staunch little sea-going power dcries shown by the Atlantic Company and the Toppan Boat Manufacturing Co., attracted much attention.

This year there was a noticeable scarcity in racing creations. The Den was the only one shown which could claim honors for speed.

Probably the motor that received the most attention was the 60 H. P. engine exhibited by James Craig, being the motor which drove the Ailsa Craig when she won the New York-Bermuda race.

News Items

During the construction of a new bridge over the Chicago river at Eighteenth street, Chicago, the city authorities are operating a motor ferry boat which is driven by a 3-cylinder, 5x6-inch Anderson Marine motor, made by Anderson Engine Co., Shelbyville, Ill.

Defoe Boat & Motor Works, Bay City, Mich., offer, in addition to a line of complete launches, knock down frames, marine motors and accessories, boat patterns for the use of amateur boat builders. Prices of patterns range from $1.75 to $12 per set, and knock down frames from $4 to $120 according to size and grade of material used. The lumber required runs from 20 to 200 feet for the frame, and from 30 to 200 feet for the planking.

The fourth annual motor boat carnival at Palm Beach, Florida, will be held the week commencing March 16, when as usual Lake Worth will be brilliantly illuminated by original fireworks, consisting of a naval battle, fireboat racing, etc. In addition to the lake carnival this year, Managers Fred Sterry and H. E. Bemis will include in the fireworks programme an illumination of the Royal Poinciana Gardens and grounds and this is to be made one of the attractive features of the week.

Gies Gear Co., Detroit, Mich., recently sent out a postal containing an illustration in colors of an under water scene, showing the propeller of a motor boat being broken by striking a rigid log standing up in the water with its top below the surface. Attention is called to the fact that such an accident would have been impossible with a "Gies" reversible propeller.

The Connecticut marine spark coil is manufactured by the Connecticut Telephone & Electric Co., Meriden, Conn., a feature of this coil being its low battery consumption, the manufacturers claiming that the coil will fire the highest compression boat engine on as low a battery consumption as 3-10ths of an ampere, by that, they mean the current drawn from the battery to operate the coil when the engine is not running; but when in operation the consumption is but one-half of this amount.

The "Connecticut" Single Cylinder Marine Spark Coil.

The cases are made of hard wood with spar varnish finish and all metal parts are nickeled except the vibrator and armature which are treated with a rust proof finish which will prevent the rusting of these parts altho they should become wet.

Both the vibrator and the contact adjusting screws are self-locking and stay in any position without any possibility of their jarring loose. The contact screw is fitted with a patented dial adjustment with which it is possible to adjust the coil to draw a given amount of current.

Altho this coil is designed especially for Marine use it will be found most satisfactory for any kind of stationary or automobile engine work. This coil is made in 1, 2, 3 and 4 cylinder types, listing at $10, 20, 30, and $40 each.

"Putnam" 1908 Marine Motors

In addition to cycle and car motors, described in our December issue, the Putnam Motor Manufacturing Co., Inc., 57 Lebanon street, Springfield, Mass., also includes in its line for 1908 several sizes of marine motors, all of the 4-cycle type, and adapted to use either gasoline or kerosene.

The 1908 marine motors are built in 1½, 2½ and 5 H. P., single cylinder, and 5 and 10 H. P., double cylinder sizes. A 4-cyl-

For Cleaning Auto Bodies

It's good to see how quickly Mobo removes mud, grease and dirt from an automobile body. It doesn't matter how long the car has gone without cleaning, or how thick the dirt may be—off it comes, easily and quickly if you use

MOBO
Automobile Cleanser

Not only does it remove all the dirt, but does it without marring or scratching the varnished surface, and without dimming the lustre in any way. That's Mobo style.

Mobo is composed of pure vegetable oils, and contains nothing rough to mark the smoothest surface. It is the ideal automobile cleanser.

Prevents the varnish and paint from cracking and blistering. Keeps the car looking new. It's the best sold to-day. Try it once and you'll understand why.

Put up in 3 lb. and 6 lb. cans; also in tubs, half-barrels and barrels. Can be had at the following supply house:

Combination Ladder Company
Jobbers of Automobile Supplies
366 Fountain Street
PROVIDENCE, R. I.

and at all good automobile supply stores in all leading cities.

own stroke of the piston, which has closed end 17, and is therefore filled gas on this down stroke. The piston ovided with an opening 13, which at ottom of the stroke registers with sage 5 leading into combustion cham-. The comprest charge therefore is ferred to the combustion chamber at nd of the down stroke and during rocess of compression and transferal nes warmed by contact with the hot and head of the piston, this tending ke the charge more combustible. As harge is drawn into chamber 2 in l state, a larger charge is obtained

AUTOMOBILE TRADE JOURNAL

onal View of the Beaton Marine Motor.

f it were warmed outside the motor. head 12 closes up the lower end of ylinder and thus enables the piston ck in a charge and to perfectly com- it. This head is also used as a cap e center bearing of the crank shaft. nnecting rod 11 is placed on each f the cylinder and connected at the after lubricating the wrist pin, passes down the rod and lubricates the crank pin. The shaft is lubricated from grease cups and an oil cup on the side of the cylinder lubricates the piston.

An overflow pipe 8 is run from the top of the water jacket to the exhaust pipe 9, thus utilizing the water to cool the exhaust. The cylinder is bolted together at 16, but no joint is required as the top of the piston is above the line of division. To remove piston it is only necessary to take out the bolts. To take up lost motion the cap screws in the connecting rods are tightened, and as they are outside the cylinder this is a simple and easy matter.

"Waterman" Canoe Power Outfit

Waterman Marine Motor Co., 1500 Fort street, West, Detroit, Mich., made an auspicious entry into the marine field early in 1906 by introducing a self-contained out-board power outfit for converting row boats into motor boats, which was described in our April, 1906, number, page 262. This company is now offering a complete power outfit of an entirely different character, and intended for installation in canoes. From the illustration it will be observed that this consists of elements of

The "Waterman" Power Outfit for Canoes.

regulation type, but it possesses several distinctive detail features. The motor is of the 2-cycle type and is rated at 2 H. P. The cylinder is of grey iron, cast without jacket and a polished, spun copper water jacket is applied. The crank case is of aluminum and bearings are bronze bushed. Crank shaft and connecting rod are of steel and the water pump and all fittings are of polished brass. The motor is 14 inches high and weighs 35 pounds. The outfit is shipt complete, including foundation pieces, all ready for installation.
